# **HTML Tutorial**

#### HTML

HTML is the standard markup language for Web pages.

With HTML you can create your own Website.

HTML is easy to learn - You will enjoy it!

# Easy Learning with HTML "Try it Yourself"

With our "Try it Yourself" editor, you can edit the HTML code and view the result:

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>
<h1>This is a Heading</h1>
This is a paragraph.
</body>
</html>
```

Click on the "Try it Yourself" button to see how it works.

# **HTML Examples**

In this HTML tutorial, you will find more than 200 examples. With our online "Try it Yourself" editor, you can edit and test each example yourself!

Go to HTML Examples!

#### **HTML Exercises**

This HTML tutorial also contains nearly 100 HTML exercises.

#### **HTML Quiz Test**

Test your HTML skills with our HTML Quiz!

#### **HTML References**

At W3Schools you will find complete references about HTML elements, attributes, events, color names, entities, charactersets, URL encoding, language codes, HTTP messages, browser support, and more:

ITML Elements
Irowser Support
Ittributes
Ilobal Attributes
Ivent Attribute

IRL Encoding
anguage Codes
Country Codes
ITTP Messages
'x to Em Converter
Ceyboard Shortcuts

# **HTML Introduction**

HTML is the standard markup language for creating Web pages.

#### What is HTML?

- HTML stands for Hyper Text Markup Language
- HTML is the standard markup language for creating Web pages
- · HTML describes the structure of a Web page
- · HTML consists of a series of elements
- . HTML elements tell the browser how to display the content
- HTML elements label pieces of content such as "this is a heading", "this is a paragraph", "this is a link", etc.

# A Simple HTML Document

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>
<h1>My First Heading</h1>
My first paragraph.
</body>
</html>
```

#### **Example Explained**

- The <!DOCTYPE html> declaration defines that this document is an HTML5 document
- The <html> element is the root element of an HTML page
- The <head> element contains meta information about the HTML page
- The <title> element specifies a title for the HTML page (which is shown in the browser's title bar or in the page's tab)
- The <body> element defines the document's body, and is a container for all the visible contents, such as headings, paragraphs, images, hyperlinks, tables, lists, etc.
- The <h1> element defines a large heading
- The element defines a paragraph

#### What is an HTML Element?

An HTML element is defined by a start tag, some content, and an end tag:

```
<tagname>Content goes here...</tagname>
```

The HTML **element** is everything from the start tag to the end tag:

<h1>My First Heading</h1>

```
My first paragraph.
```

#### Start tag Element content End tag

<h1> My First Heading </h1> <h1> My first

paragraph. <br/> <br/> none none

**Note:** Some HTML elements have no content (like the <br/>br> element). These elements are called empty elements. Empty elements do not have an end tag!

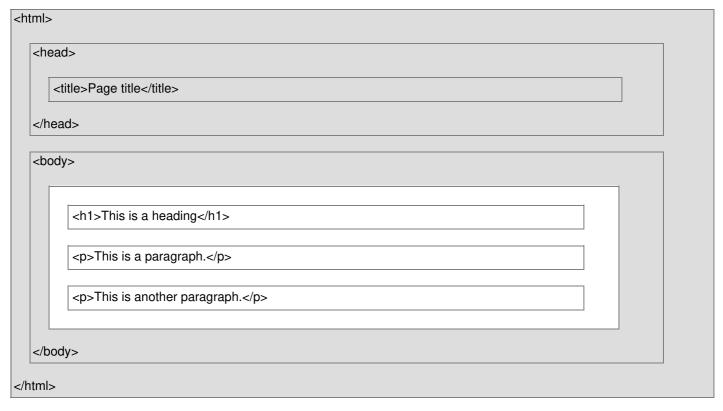

#### **Web Browsers**

The purpose of a web browser (Chrome, Edge, Firefox, Safari) is to read HTML documents and display them correctly.

A browser does not display the HTML tags, but uses them to determine how to display the document:

# HTML Page Structure

Below is a visualization of an HTML page structure:

**Note:** The content inside the <body> section (the white area above) will be displayed in a browser. The content inside the <ti>title> element will be shown in the browser's title bar or in the page's tab.

# **HTML History**

Since the early days of the World Wide Web, there have been many versions of HTML:

Year Version
1989 Tim Berners-Lee invented www
1991 Tim Berners-Lee invented HTML
1993 Dave Raggett drafted HTML+
1995 HTML Working Group defined HTML 2.0

1997 W3C Recommendation: HTML 3.2 1999 W3C Recommendation: HTML 4.01 2000 W3C Recommendation: XHTML 1.0 2008 WHATWG HTML5 First Public Draft 2012 WHATWG HTML5 Living Standard 2014 W3C Recommendation: HTML5

2016 W3C Candidate Recommendation: HTML 5.1 2017 W3C Recommendation: HTML5.1 2nd Edition

2017 W3C Recommendation: HTML5.2

This tutorial follows the latest HTML5 standard.

# **HTML Editors**

A simple text editor is all you need to learn HTML.

# Learn HTML Using Notepad or TextEdit

Web pages can be created and modified by using professional HTML editors.

However, for learning HTML we recommend a simple text editor like Notepad (PC) or TextEdit (Mac).

We believe in that using a simple text editor is a good way to learn HTML.

Follow the steps below to create your first web page with Notepad or TextEdit.

# Step 1: Open Notepad (PC)

Windows 8 or later:

Open the Start Screen (the window symbol at the bottom left on your screen). TypeNotepad.

Windows 7 or earlier:

Open Start > Programs > Accessories > Notepad

# Step 1: Open TextEdit (Mac)

Open Finder > Applications > TextEdit

Also change some preferences to get the application to save files correctly. In Preferences > Format > choose "Plain Text"

Then under "Open and Save", check the box that says "Display HTML files as HTML code instead of formatted text".

Then open a new document to place the code.

# Step 2: Write Some HTML

Write or copy the following HTML code into Notepad:

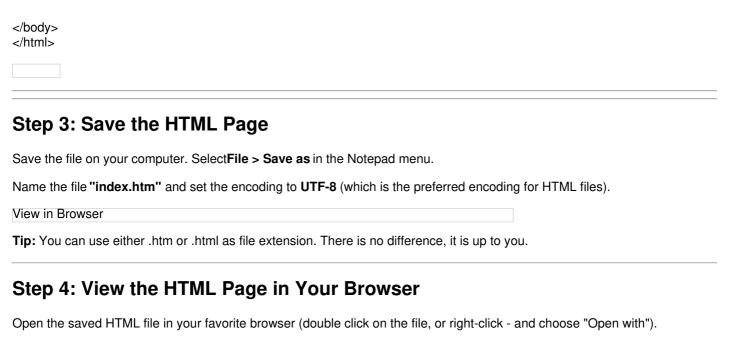

<!DOCTYPE html>

<html>

<body>

<h1>My First Heading</h1>

My first paragraph.

The result will look much like this:

# W3Schools Online Editor - "Try it Yourself"

With our free online editor, you can edit the HTML code and view the result in your browser.

It is the perfect tool when you want to **test** code fast. It also has color coding and the ability to save and share code with others:

#### Example

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>
<h1>This is a Heading</h1>
This is a paragraph.
</body>
</html>
```

Click on the "Try it Yourself" button to see how it works.

# **HTML Basic Examples**

In this chapter we will show some basic HTML examples.

Don't worry if we use tags you have not learned about yet.

#### **HTML Documents**

All HTML documents must start with a document type declaration:<!DOCTYPE html>.

The HTML document itself begins with <html> and ends with </html>.

The visible part of the HTML document is between<body> and </body>.

#### **Example**

```
<!DOCTYPE html>
<html>
<body>
<h1>My First Heading</h1>
My first paragraph.
</body>
</html>
```

#### The <!DOCTYPE> Declaration

The <!DOCTYPE> declaration represents the document type, and helps browsers to display web pages correctly.

It must only appear once, at the top of the page (before any HTML tags).

The <!DOCTYPE> declaration is not case sensitive.

The <!DOCTYPE> declaration for HTML5 is:

<!DOCTYPE html>

# **HTML Headings**

HTML headings are defined with the <h1> to <h6> tags.

<h1> defines the most important heading. <h6> defines the least important heading:Â

#### **Example**

```
<h1>This is heading 1</h1>
<h2>This is heading 2</h2>
<h3>This is heading 3</h3>
```

# **HTML Paragraphs**

HTML paragraphs are defined with the tag:

#### **Example**

```
This is a paragraph.
This is another paragraph.
```

#### **HTML Links**

HTML links are defined with the <a> tag:

#### **Example**

<a href="https://www.w3schools.com">This is a link</a>

The link's destination is specified in thehref attribute.Â

Attributes are used to provide additional information about HTML elements.

You will learn more about attributes in a later chapter.

# HTML Images

HTML images are defined with the <img> tag.

The source file (src), alternative text (alt), width, and height are provided as attributes:

#### **Example**

<img src="w3schools.jpg" alt="W3Schools.com" width="104" height="142">

#### **How to View HTML Source?**

Have you ever seen a Web page and wondered "Hey! How did they do that?"

#### **View HTML Source Code:**

Right-click in an HTML page and select "View Page Source" (in Chrome) or "View Source" (in Edge), or similar in other browsers. This will open a window containing the HTML source code of the page.

#### **Inspect an HTML Element:**

Right-click on an element (or a blank area), and choose "Inspect" or "Inspect Element" to see what elements are made up of (you will see both the HTML and the CSS). You can also edit the HTML or CSS on-the-fly in the Elements or Styles panel that opens.

# **HTML Elements**

An HTML element is defined by a start tag, some content, and an end tag.

#### **HTML Elements**

The HTML **element** is everything from the start tag to the end tag:

```
<tagname>Content goes here...</tagname>
```

Examples of some HTML elements:

```
<h1>My First Heading</h1>
```

My first paragraph.

#### Start tag Element content End tag

<h1> My First Heading </h1>

**Note:** Some HTML elements have no content (like the <br/> element). These elements are called empty elements. Empty elements do not have an end tag!

#### **Nested HTML Elements**

HTML elements can be nested (this means that elements can contain other elements).

All HTML documents consist of nested HTML elements.

The following example contains four HTML elements (<html>, <body>, <h1> and ):

#### **Example**

```
<!DOCTYPE html>
```

<html>

<body>

```
<h1>My First Heading</h1>
My first paragraph.
</body>
</html>
Example Explained
The <html> element is the root element and it defines the whole HTML document.
It has a start tag <html> and an end tag </html>.
Then, inside the <a href="html"><a href="html">html</a> element there is a <body> element:
<body>
<h1>My First Heading</h1>
My first paragraph.
</body>
The <body> element defines the document's body.
It has a start tag <body> and an end tag </body>.
Then, inside the <body> element there are two other elements: <h1> and :
<h1>My First Heading</h1>
My first paragraph.
The <h1> element defines a heading.
It has a start tag <h1> and an end tag </h1>:
<h1>My First Heading</h1>
The  element defines a paragraph.
```

# Never Skip the End Tag

My first paragraph.

It has a start tag and an end tag :

Some HTML elements will display correctly, even if you forget the end tag:

#### **Example**

```
<html>
<body>
This is a paragraph
This is a paragraph
</body>
</html>
```

However, never rely on this! Unexpected results and errors may occur if you forget the end tag!

# **Empty HTML Elements**

HTML elements with no content are called empty elements.

The <br/>br> tag defines a line break, and is an empty element without a closing tag:

#### **HTML** is Not Case Sensitive

HTML tags are not case sensitive: <P> means the same as .

The HTML standard does not require lowercase tags, but W3C **recommends** lowercase in HTML, and **demands** lowercase for stricter document types like XHTML.

At W3Schools we always use lowercase tag names.

### **HTML Tag Reference**

W3Schools' tag reference contains additional information about these tags and their attributes.

Tag	Description
<html></html>	Defines the root of an HTML document
<body></body>	Defines the document's body
<h1> to <h6></h6></h1>	Defines HTML headings

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Attributes**

HTML attributes provide additional information about HTML elements.

#### **HTML Attributes**

- · All HTML elements can have attributes
- Attributes provide additional information about elements
- · Attributes are always specified in the start tag
- Attributes usually come in name/value pairs like: name="value"

#### The href Attribute

The <a> tag defines a hyperlink. The href attribute specifies the URL of the page the link goes to:

#### **Example**

<a href="https://www.w3schools.com">Visit W3Schools</a>

You will learn more about links in our HTML Links chapter.

#### The src Attribute

The <img> tag is used to embed an image in an HTML page. The src attribute specifies the path to the image to be displayed:

#### **Example**

<img src="img\_girl.jpg">

There are two ways to specify the URL in thesrc attribute:

**1. Absolute URL** - Links to an external image that is hosted on another website. Example: src="https://www.w3schools.com/images/img\_girl.jpg".

**Notes:** External images might be under copyright. If you do not get permission to use it, you may be in violation of copyright laws. In addition, you cannot control external images; it can suddenly be removed or changed.

2. Relative URL - Links to an image that is hosted within the website. Here, the URL does not include the domain name. If the URL begins without a slash, it will be relative to the current page. Example: src="img\_girl.jpg". If the URL begins with a slash, it will be relative to the domain. Example: src="/images/img\_girl.jpg".

**Tip:** It is almost always best to use relative URLs. They will not break if you change domain.

# The width and height Attributes

The <img> tag should also contain the width and height attributes, which specifies the width and height of the image (in pixels):

#### **Example**

<img src="img\_girl.jpg" width="500" height="600">

#### The alt Attribute

The required alt attribute for the <img> tag specifies an alternate text for an image, if the image for some reason cannot be displayed. This can be due to slow connection, or an error in the src attribute, or if the user uses a screen reader.

#### **Example**

<img src="img\_girl.jpg" alt="Girl with a jacket">

#### **Example**

See what happens if we try to display an image that does not exist:

<img src="img\_typo.jpg" alt="Girl with a jacket">

You will learn more about images in our HTML Images chapter.

# The style Attribute

The style attribute is used to add styles to an element, such as color, font, size, and more.

#### Example

This is a red paragraph.

You will learn more about styles in our HTML Styles chapter.

# The lang Attribute

You should always include the lang attribute inside the <a href="html">- tag</a>, to declare the language of the Web page. This is meant to assist search engines and browsers.

The following example specifies English as the language:

```
<!DOCTYPE html>
<html lang="en">
<body>
...
</body>
</html>
```

Country codes can also be added to the language code in the anguage attribute. So, the first two characters define the language of the HTML page, and the last two characters define the country.

The following example specifies English as the language and United States as the country:

<!DOCTYPE html>

```
<html lang="en-US">
<body>
...
</body>
</html>
```

You can see all the language codes in our HTML Language Code Reference.

#### The title Attribute

The title attribute defines some extra information about an element.

The value of the title attribute will be displayed as a tooltip when you mouse over the element:

#### **Example**

This is a paragraph.

# We Suggest: Always Use Lowercase Attributes

The HTML standard does not require lowercase attribute names.

The title attribute (and all other attributes) can be written with uppercase or lowercase like title or TITLE.

However, W3C **recommends** lowercase attributes in HTML, and **demands** lowercase attributes for stricter document types like XHTML.

At W3Schools we always use lowercase attribute names.

# We Suggest: Always Quote Attribute Values

The HTML standard does not require quotes around attribute values.

However, W3C recommends quotes in HTML, and demands quotes for stricter document types like XHTML.

#### Good:

<a href="https://www.w3schools.com/html/">Visit our HTML tutorial</a>

#### Bad:

<a href=https://www.w3schools.com/html/>Visit our HTML tutorial</a>

Sometimes you have to use quotes. This example will not display the title attribute correctly, because it contains a space:

#### Example

À At W3Schools we always use quotes around attribute values.

# Single or Double Quotes?

Double quotes around attribute values are the most common in HTML, but single quotes can also be used.

In some situations, when the attribute value itself contains double quotes, it is necessary to use single quotes:

Or vice versa:

# **Chapter Summary**

- · All HTML elements can have attributes
- The href attribute of <a> specifies the URL of the page the link goes to
- The src attribute of <img> specifies the path to the image to be displayed
- The width and height attributes of <img> provide size information for images
- The alt attribute of <img> provides an alternate text for an image
- The style attribute is used to add styles to an element, such as color, font, size, and more
- The lang attribute of the <html> tag declares the language of the Web page
- The title attribute defines some extra information about an element

#### **HTML Exercises**

#### **HTML Attribute Reference**

A complete list of all attributes for each HTML element, is listed in our:HTML Attribute Reference.

# **HTML Headings**

HTML headings are titles or subtitles that you want to display on a webpage.

#### **Example**

# **Heading 1**

# **Heading 2**

**Heading 3** 

Heading 4

Heading 5

Heading 6

# **HTML Headings**

HTML headings are defined with the <h1> to <h6> tags.

<h1> defines the most important heading. <h6> defines the least important heading.

#### **Example**

<h1>Heading 1</h1>

<h2>Heading 2</h2>

<h3>Heading 3</h3>

<h4>Heading 4</h4>

<h5>Heading 5</h5>

<h6>Heading 6</h6>

Note: Browsers automatically add some white space (a margin) before and after a heading.

# **Headings Are Important**

Search engines use the headings to index the structure and content of your web pages.

Users often skim a page by its headings. It is important to use headings to show the document structure.

<h1> headings should be used for main headings, followed by <h2> headings, then the less important <h3>, and so on.

Note: Use HTML headings for headings only. Don't use headings to make text BIG or bold.

# **Bigger Headings**

Each HTML heading has a default size. However, you can specify the size for any heading with the style attribute, using the CSS font-size property:

#### **Example**

<h1 style="font-size:60px;">Heading 1</h1>

#### **HTML Exercises**

# **HTML Tag Reference**

W3Schools' tag reference contains additional information about these tags and their attributes.

Tag	Description
<html></html>	Defines the root of an HTML document
<body></body>	Defines the document's body
<h1> to <h6></h6></h1>	Defines HTML headings

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Paragraphs**

A paragraph always starts on a new line, and is usually a block of text.

# **HTML Paragraphs**

The HTML element defines a paragraph.

A paragraph always starts on a new line, and browsers automatically add some white space (a margin) before and after a paragraph.

#### **Example**

```
This is a paragraph.
This is another paragraph.
```

# **HTML Display**

You cannot be sure how HTML will be displayed.

Large or small screens, and resized windows will create different results.

With HTML, you cannot change the display by adding extra spaces or extra lines in your HTML code.

The browser will automatically remove any extra spaces and lines when the page is displayed:

This paragraph contains a lot of lines in the source code, but the browser ignores it.

This paragraph contains Â Â Â Â Â a lot of spaces in the source Â Â Â Â code, but the Â Â Â Browser ignores it.

### **HTML Horizontal Rules**

The <hr> tag defines a thematic break in an HTML page, and is most often displayed as a horizontal rule.

The <hr> element is used to separate content (or define a change) in an HTML page:

#### **Example**

<h1>This is heading 1</h1>
This is some text.
<hr>
<h2>This is heading 2</h2>
This is heading 2</h2>
This is some other text.
<hr>

The <hr>> tag is an empty tag, which means that it has no end tag.

#### **HTML Line Breaks**

The HTML <br > element defines a line break.

Use <br/> if you want a line break (a new line) without starting a new paragraph:

#### **Example**

This is<br/>br>a paragraph<br/>br>with line breaks.

The <br/>br> tag is an empty tag, which means that it has no end tag.

#### The Poem Problem

This poem will display on a single line:

#### **Example**

>

My Bonnie lies over the ocean.

My Bonnie lies over the sea.

My Bonnie lies over the ocean.

Oh, bring back my Bonnie to me.

# Solution - The HTML Element

The HTML element defines preformatted text.

The text inside a element is displayed in a fixed-width font (usually Courier), and it preserves both spaces and line breaks:

#### **Example**

<

My Bonnie lies over the ocean.

My Bonnie lies over the sea.

My Bonnie lies over the ocean.

Oh, bring back my Bonnie to me.

#### **HTML Exercises**

# **HTML Tag Reference**

W3Schools' tag reference contains additional information about HTML elements and their attributes.

#### 

content

<br> Inserts a single line break

Defines pre-formatted text

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Styles**

The HTML style attribute is used to add styles to an element, such as color, font, size, and more.

#### **Example**

I am Red

I am Blue

# I am Big

# The HTML Style Attribute

Setting the style of an HTML element, can be done with thestyle attribute.

The HTML style attribute has the following syntax:

<tagname style="property:value;">

The *property* is a CSS property. The *value* is a CSS value.

You will learn more about CSS later in this tutorial.

# **Background Color**

The CSS background-color property defines the background color for an HTML element.

#### **Example**

```
Set the background color for a page to powderblue:
```

```
<body style="background-color:powderblue;">
<h1>This is a heading</h1>
This is a paragraph.
</body>
```

#### **Example**

Set background color for two different elements:

```
<br/><bdy>
<h1 style="background-color:powderblue;">This is a heading</h1>
This is a paragraph.
</body>
```

#### **Text Color**

The CSS color property defines the text color for an HTML element:

#### **Example**

```
<h1 style="color:blue;">This is a heading</h1>This is a paragraph.
```

#### **Fonts**

The CSS font-family property defines the font to be used for an HTML element:

#### **Example**

```
<h1 style="font-family:verdana;">This is a heading</h1>This is a paragraph.
```

#### **Text Size**

The CSS font-size property defines the text size for an HTML element:

#### **Example**

```
<h1 style="font-size:300%;">This is a heading</h1>This is a paragraph.
```

# **Text Alignment**

The CSS text-align property defines the horizontal text alignment for an HTML element:

#### **Example**

```
<h1 style="text-align:center;">Centered Heading</h1>Centered paragraph.
```

# **Chapter Summary**

· Use the style attribute for styling HTML elements

- · Use background-color for background color
- Use color for text colors
- Use font-family for text fonts
- Use font-size for text sizes
- Use text-align for text alignment

#### **HTML Exercises**

# **HTML Text Formatting**

HTML contains several elements for defining text with a special meaning.

#### **Example**

#### This text is bold

This text is italic

This is subscript and superscript

# **HTML Formatting Elements**

Formatting elements were designed to display special types of text:

- <b> Bold text
- <strong> Important text
- <i> Italic text
- <em> Emphasized text
- <mark> Marked text
- <small> Smaller text
- <del> Deleted text
- <ins> Inserted text
- <sub> Subscript text
- <sup> Superscript text

# HTML <b> and <strong> Elements

The HTML <b> element defines bold text, without any extra importance.

#### **Example**

<b>This text is bold</b>

The HTML <strong> element defines text with strong importance. The content inside is typically displayed in bold.

#### **Example**

<strong>This text is important!</strong>

#### HTML <i> and <em> Elements

The HTML <i> element defines a part of text in an alternate voice or mood. The content inside is typically displayed in italic.

Tip: The <i> tag is often used to indicate a technical term, a phrase from another language, a thought, a ship name, etc.

<i>This text is italic</i>

The HTML <em> element defines emphasized text. The content inside is typically displayed in italic.

Tip: A screen reader will pronounce the words in <em> with an emphasis, using verbal stress.

#### **Example**

<em>This text is emphasized</em>

#### HTML <small> Element

The HTML <small> element defines smaller text:

#### Example

<small>This is some smaller text.</small>

#### HTML <mark> Element

The HTML <mark> element defines text that should be marked or highlighted:

#### **Example**

Do not forget to buy <mark>milk</mark> today.

#### HTML <del> Element

The HTML <del> element defines text that has been deleted from a document. Browsers will usually strike a line through deleted text:

#### **Example**

My favorite color is <del>blue</del> red.

#### HTML <ins> Element

The HTML <ins> element defines a text that has been inserted into a document. Browsers will usually underline inserted text:

#### **Example**

My favorite color is <del>blue</del> <ins>red</ins>.

#### HTML <sub> Element

The HTML <sub> element defines subscript text. Subscript text appears half a character below the normal line, and is sometimes rendered in a smaller font. Subscript text can be used for chemical formulas, like H<sub>2</sub>O:

#### **Example**

This is <sub>subscripted</sub> text.

# HTML <sup> Element

The HTML <sup> element defines superscript text. Superscript text appears half a character above the normal line, and is sometimes rendered in a smaller font. Superscript text can be used for footnotes, like WWW<sup>[1]</sup>:

#### Example

This is <sup>superscripted</sup> text.

# **HTML Text Formatting Elements**

Tag Description

<br/>Defines bold text

<u><em></u> Defines emphasized textÂ

Defines a part of text in an alternate voice or

mood

<mark> Defines marked/highlighted text

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Quotation and Citation Elements**

In this chapter we will go through the <blockquote>,<q>, <abbr>, <address>, <cite>, and <bdo> HTML elements.

#### **Example**

Here is a quote from WWF's website:

For nearly 60 years, WWF has been protecting the future of nature. The world's leading conservation organization, WWF works in 100 countries and is supported by more than one million members in the United States and close to five million globally.

# HTML <blockquote> for Quotations

The HTML <blockquote> element defines a section that is quoted from another source.

Browsers usually indent <blockquote> elements.

#### **Example**

# **HTML** <q> for Short Quotations

The HTML <q> tag defines a short quotation.

Browsers normally insert quotation marks around the quotation.

#### HTML <abbr> for Abbreviations

The HTML <abbr> tag defines an abbreviation or an acronym, like "HTML", "CSS", "Mr.", "Dr.", "ASAP", "ATM".

Marking abbreviations can give useful information to browsers, translation systems and search-engines.

Tip: Use the global title attribute to show the description for the abbreviation/acronym when you mouse over the element.Â

#### **Example**

The <abbr title="World Health Organization">WHO</abbr> was founded in 1948.

#### HTML <address> for Contact Information

The HTML <address> tag defines the contact information for the author/owner of a document or an article.

The contact information can be an email address, URL, physical address, phone number, social media handle, etc.

The text in the <address> element usually renders in *italic*, and browsers will always add a line break before and after the <address> element.

#### **Example**

<address>
Written by John Doe.<br>
Visit us at:<br>
Example.com<br>
Box 564, Disneyland<br>
USA
</address>

#### HTML <cite> for Work Title

The HTML <cite> tag defines the title of a creative work (e.g. a book, a poem, a song, a movie, a painting, a sculpture, etc.).

Note: A person's name is not the title of a work.

The text in the <cite> element usually renders in italic.

#### **Example**

<cite>The Scream</cite> by Edvard Munch. Painted in 1893.

#### HTML <bdo> for Bi-Directional Override

BDO stands for Bi-Directional Override.

The HTML <bdo> tag is used to override the current text direction:

#### **Example**

<bdo dir="rtl">This text will be written from right to left</bdo>

### **HTML Exercises**

#### **HTML Quotation and Citation Elements**

Tag Description

<abbr> Defines an abbreviation or acronym</a>

<address> Defines contact information for the author/owner of a

document

<br/>bdo> Defines the text direction

<blockquote>
Defines a section that is quoted from another source

<a href="mailto:color: blue;"><cite></a>
Defines the title of a work
<a href="mailto:color: blue;"><q></a>
Defines a short inline quotation

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Comments**

HTML comments are not displayed in the browser, but they can help document your HTML source code.

# **HTML Comment Tags**

You can add comments to your HTML source by using the following syntax:

<!-- Write your comments here -->

Notice that there is an exclamation point (!) in the start tag, but not in the end tag.

Note: Comments are not displayed by the browser, but they can help document your HTML source code.

With comments you can place notifications and reminders in your HTML code:

#### **Example**

```
<!-- This is a comment -->
```

This is a paragraph.

<!-- Remember to add more information here -->

Comments are also great for debugging HTML, because you can comment out HTML lines of code, one at a time, to search for errors:

#### Example

```
<!-- Do not display this image at the moment 
<img border="0" src="pic_trulli.jpg" alt="Trulli"> 
-->
```

#### **HTML Exercises**

# **HTML Colors**

HTML colors are specified with predefined color names, or with RGB, HEX, HSL, RGBA, or HSLA values.

#### **Color Names**

In HTML, a color can be specified by using a color name:

Drange	
)odgerBlue	
1ediumSeaGreen	
Gray	
SlateBlue	
ʻiolet	
ightGray	

#### Try it Yourself »

HTML supports 140 standard color names.

# **Background Color**

You can set the background color for HTML elements:

# Hello World

Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat. Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex ea commodo consequat.

#### **Example**

<h1 style="background-color:DodgerBlue;">Hello World</h1>style="background-color:Tomato;">Lorem ipsum...

#### **Text Color**

You can set the color of text:

#### **Hello World**

Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat.

Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex ea commodo consequat.

<h1 style="color:Tomato;">Hello World</h1>
Lorem ipsum...
Ut wisi enim...

#### **Border Color**

You can set the color of borders:

#### Hello World

#### Hello World

#### Hello World

#### **Example**

```
<h1 style="border:2px solid Tomato;">Hello World</h1>
<h1 style="border:2px solid DodgerBlue;">Hello World</h1>
<h1 style="border:2px solid Violet;">Hello World</h1>
```

#### **Color Values**

In HTML, colors can also be specified using RGB values, HEX values, HSL values, RGBA values, and HSLA values.

The following three <div> elements have their background color set with RGB, HEX, and HSL values:

rgb(255, 99, 71)

#ff6347

hsl(9, 100%, 64%)

The following two <div> elements have their background color set with RGBA and HSLA values, which adds an Alpha channel to the color (here we have 50% transparency):

rgba(255, 99, 71, 0.5)

hsla(9, 100%, 64%, 0.5)

#### **Example**

```
<h1 style="background-color:rgb(255, 99, 71);">...</h1>
<h1 style="background-color:#ff6347;">...</h1>
<h1 style="background-color:hsl(9, 100%, 64%);">...</h1>
<h1 style="background-color:rgba(255, 99, 71, 0.5);">...</h1>
<h1 style="background-color:hsla(9, 100%, 64%, 0.5);">...</h1>
```

#### **Learn more about Color Values**

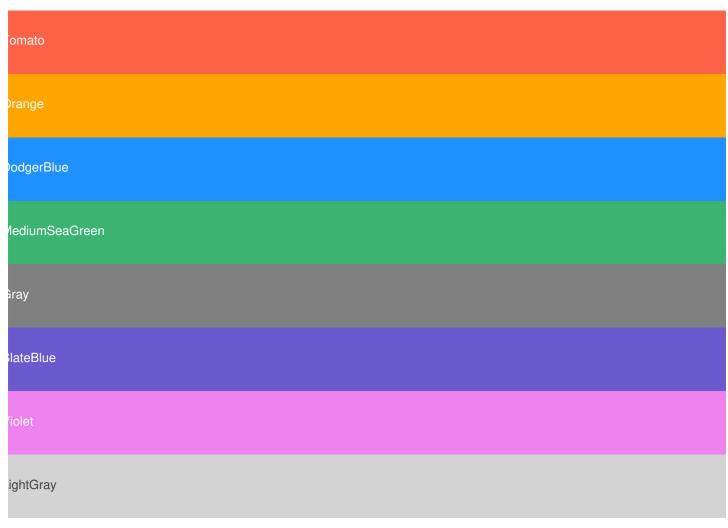

You will learn more about RGB, HEX and HSL in the next chapters.

# **HTML Colors**

HTML colors are specified with predefined color names, or with RGB, HEX, HSL, RGBA, or HSLA values.

#### **Color Names**

```

### **Border Color**

You can set the color of borders:

### Hello World

#### Hello World

#### Hello World

#### **Example**

```
<h1 style="border:2px solid Tomato;">Hello World</h1>
<h1 style="border:2px solid DodgerBlue;">Hello World</h1>
<h1 style="border:2px solid Violet;">Hello World</h1>
```

#### **Color Values**

In HTML, colors can also be specified using RGB values, HEX values, HSL values, RGBA values, and HSLA values.

The following three <div> elements have their background color set with RGB, HEX, and HSL values:

```
rgb(255, 99, 71)
```

#ff6347

hsl(9, 100%, 64%)

The following two <div> elements have their background color set with RGBA and HSLA values, which adds an Alpha channel to the color (here we have 50% transparency):

rgba(255, 99, 71, 0.5)

hsla(9, 100%, 64%, 0.5)

```
<h1 style="background-color:rgb(255, 99, 71);">...</h1>
<h1 style="background-color:#ff6347;">...</h1>
<h1 style="background-color:hsl(9, 100%, 64%);">...</h1>
<h1 style="background-color:rgba(255, 99, 71, 0.5);">...</h1>
<h1 style="background-color:hsla(9, 100%, 64%, 0.5);">...</h1>
```

#### **Learn more about Color Values**

You will learn more about RGB, HEX and HSL in the next chapters.

# HTML RGB and RGBA Colors

An RGB color value represents RED, GREEN, and BLUE light sources.

An RGBA color value is an extension of RGB with an Alpha channel (opacity).

#### **RGB Color Values**

In HTML, a color can be specified as an RGB value, using this formula:

#### rgb(red, green, blue)

Each parameter (red, green, and blue) defines the intensity of the color with a value between 0 and 255.

This means that there are  $256 \times 256 \times 256 = 16777216$  possible colors!

For example, rgb(255, 0, 0) is displayed as red, because red is set to its highest value (255), and the other two (green and blue) are set to 0.

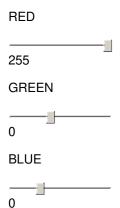

Another example, rgb(0, 255, 0) is displayed as green, because green is set to its highest value (255), and the other two (red and blue) are set to 0.

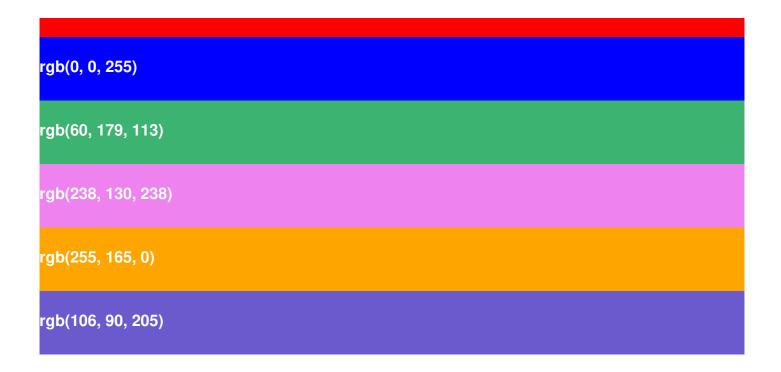

To display black, set all color parameters to 0, like this: rgb(0, 0, 0).

To display white, set all color parameters to 255, like this: rgb(255, 255, 255).

Experiment by mixing the RGB values below:

#### Â

# **Shades of Gray**

Shades of gray are often defined using equal values for all three parameters:

### **Example**

```
rgb(60, 60, 60)

rgb(100, 100, 100)

rgb(140, 140, 140)

rgb(180, 180, 180)

rgb(200, 200, 200)

rgb(240, 240, 240)
```

#### **RGBA Color Values**

RGBA color values are an extension of RGB color values with an Alpha channel - which specifies the opacity for a color.

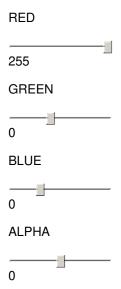

An RGBA color value is specified with:

#### rgba(red, green, blue, alpha)

The alpha parameter is a number between 0.0 (fully transparent) and 1.0 (not transparent at all):

Experiment by mixing the RGBA values below:

#### Â

#### **Example**

rgba(255, 99, 71, 0)

```
rgba(255, 99, 71, 0.2)

rgba(255, 99, 71, 0.4)

rgba(255, 99, 71, 0.6)

rgba(255, 99, 71, 0.8)

rgba(255, 99, 71, 1)
```

# **HTML HEX Colors**

A hexadecimal color is specified with: #RRGGBB, where the RR (red), GG (green) and BB (blue) hexadecimal integers specify the components of the color.

#### **HEX Color Values**

In HTML, a color can be specified using a hexadecimal value in the form:

#### #rrggbb

Where rr (red), gg (green) and bb (blue) are hexadecimal values between 00 and ff (same as decimal 0-255).

For example, #ff0000 is displayed as red, because red is set to its highest value (ff), and the other two (green and blue) are set to 00.

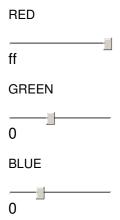

Another example, #00ff00 is displayed as green, because green is set to its highest value (ff), and the other two (red and blue) are set to 00.

To display black, set all color parameters to 00, like this: #000000.

To display white, set all color parameters to ff, like this: #ffffff.

Experiment by mixing the HEX values below:

#### Â

#### **Example**

```
#ff0000
#0000ff

#3cb371

#ee82ee

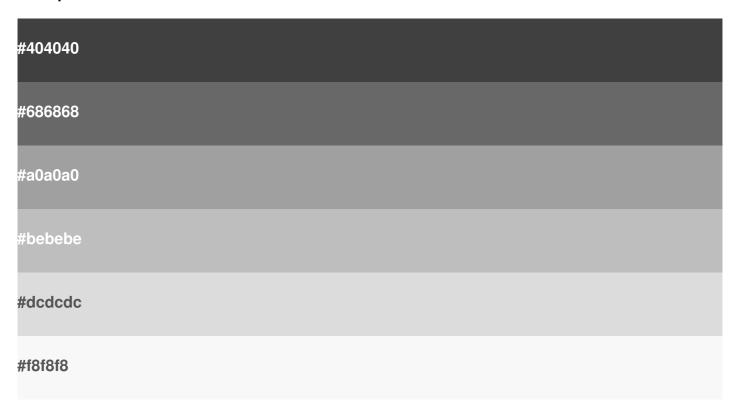

#ffa500

#6a5acd
```

# **Shades of Gray**

Shades of gray are often defined using equal values for all three parameters:

#### **Example**

# **HTML HSL and HSLA Colors**

HSL stands for hue, saturation, and lightness.

HSLA color values are an extension of HSL with an Alpha channel (opacity).

#### **HSL Color Values**

In HTML, a color can be specified using hue, saturation, and lightness (HSL) in the form:

#### hsl(hue, saturation, lightness)

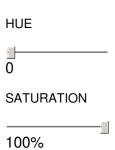

Hue is a degree on the color wheel from 0 to 360. 0 is red, 120 is green, and 240 is blue.

Saturation is a percentage value, 0% means a shade of gray, and 100% is the full color.

Lightness is also a percentage value, 0% is black, and 100% is white.

Experiment by mixing the HSL values below:

#### Â

# LIGHTNESS 50%

#### **Example**

#### **Saturation**

Saturation can be described as the intensity of a color.

100% is pure color, no shades of gray

50% is 50% gray, but you can still see the color.

0% is completely gray, you can no longer see the color.

hsl(0, 0%, 50%)

#### Lightness

The lightness of a color can be described as how much light you want to give the color, where 0% means no light (black), 50% means 50% light (neither dark nor light) 100% means full lightness (white).

#### **Example**

hsl(0, 100%, 100%)

# **Shades of Gray**

Shades of gray are often defined by setting the hue and saturation to 0, and adjust the lightness from 0% to 100% to get darker/lighter shades:

```
hsl(0, 0%, 20%)
hsl(0, 0%, 30%)
hsl(0, 0%, 40%)
hsl(0, 0%, 60%)
hsl(0, 0%, 70%)
```

hsl(0, 0%, 90%)

#### **HSLA Color Values**

HSLA color values are an extension of HSL color values with an Alpha channel - which specifies the opacity for a color.

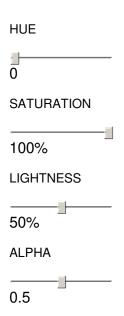

An HSLA color value is specified with:

#### hsla(hue, saturation, lightness, alpha)

The alpha parameter is a number between 0.0 (fully transparent) and 1.0 (not transparent at all):

Experiment by mixing the HSLA values below:

### Â

#### **Example**

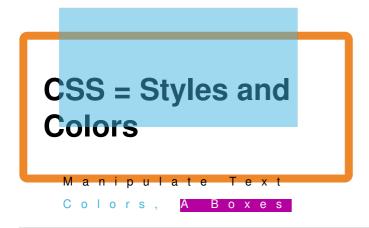

hsla(9, 100%, 64%, 0)

```
hsla(9, 100%, 64%, 0.2)
hsla(9, 100%, 64%, 0.4)
hsla(9, 100%, 64%, 0.6)
hsla(9, 100%, 64%, 0.8)
```

# **HTML Styles - CSS**

CSS stands for Cascading Style Sheets.

CSS saves a lot of work. It can control the layout of multiple web pages all at once.

#### What is CSS?

Cascading Style Sheets (CSS) is used to format the layout of a webpage.

With CSS, you can control the color, font, the size of text, the spacing between elements, how elements are positioned and laid out, what background images or background colors are to be used, different displays for different devices and screen sizes, and much more!

**Tip:** The word **cascading** means that a style applied to a parent element will also apply to all children elements within the parent. So, if you set the color of the body text to "blue", all headings, paragraphs, and other text elements within the body will also get the same color (unless you specify something else)!

# **Using CSS**

CSS can be added to HTML documents in 3 ways:

- Inline by using the style attribute inside HTML elements
- Internal by using a <style> element in the <head> section
- External by using a < link> element to link to an external CSS file

The most common way to add CSS, is to keep the styles in external CSS files. However, in this tutorial we will use inline and internal styles, because this is easier to demonstrate, and easier for you to try it yourself.

#### **Inline CSS**

An inline CSS is used to apply a unique style to a single HTML element.

An inline CSS uses the style attribute of an HTML element.

The following example sets the text color of the<h1> element to blue, and the text color of the element to red:

#### **Example**

<h1 style="color:blue;">A Blue Heading</h1>

#### **Internal CSS**

An internal CSS is used to define a style for a single HTML page.

An internal CSS is defined in the <nead> section of an HTML page, within a <style> element.

The following example sets the text color of ALL the<h1> elements (on that page) to blue, and the text color of ALL the elements to red. In addition, the page will be displayed with a "powderblue" background color:Â

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
<style>
body {background-color: powderblue;}
h1ÂÂ {color: blue;}
pÂÂÂ (color: red;}
</style>
</head>
<body>
<h1>This is a heading</h1>
This is a paragraph.
</body>
</html>
```

#### **External CSS**

An external style sheet is used to define the style for many HTML pages.

To use an external style sheet, add a link to it in the<head> section of each HTML page:

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
 <link rel="stylesheet" href="styles.css">
</head>
<body>
<h1>This is a heading</h1>
This is a paragraph.
</body>
</html>
```

The external style sheet can be written in any text editor. The file must not contain any HTML code, and must be saved with a .css extension.

Here is what the "styles.css" file looks like:

#### "styles.css":

```
body {
    Â Â background-color: powderblue;
}
h1 {
    Â color: blue;
}
p {
    Â Â color: red;
```

}

Tip: With an external style sheet, you can change the look of an entire web site, by changing one file!

# **CSS Colors, Fonts and Sizes**

Here, we will demonstrate some commonly used CSS properties. You will learn more about them later.

The CSS color property defines the text color to be used.

The CSS font-family property defines the font to be used.

The CSS font-size property defines the text size to be used.

#### Example

Use of CSS color, font-family and font-size properties:

```
<!DOCTYPE html>
<html>
<head>
<style>
h1 {
 Â color: blue;
 Â font-family: verdana;
 Â font-size: 300%;
p {
 color: red;
A font-family: courier;
A font-size: 160%;
</style>
</head>
<body>
<h1>This is a heading</h1>
This is a paragraph.
</body>
</html>
```

#### **CSS Border**

The CSS border property defines a border around an HTML element.

Tip: You can define a border for nearly all HTML elements.

#### **Example**

```
Use of CSS border property:Â
p {
 Â border: 2px solid powderblue;
}
```

# **CSS Padding**

The CSS padding property defines a padding (space) between the text and the border.

#### **Example**

Use of CSS border and padding properties:

```
p { \hat{A} border: 2px solid powderblue;
```

```
A padding: 30px;
```

## **CSS Margin**

The CSS margin property defines a margin (space) outside the border.

## **Example**

```
Use of CSS border and margin properties:
```

```
p {
 border: 2px solid powderblue;
 Â margin: 50px;
}
```

## Link to External CSS

External style sheets can be referenced with a full URL or with a path relative to the current web page.

## **Example**

This example uses a full URL to link to a style sheet:

k rel="stylesheet" href="https://www.w3schools.com/html/styles.css">

## **Example**

This example links to a style sheet located in the html folder on the current web site:Â

<link rel="stylesheet" href="/html/styles.css">

## **Example**

This example links to a style sheet located in the same folder as the current page:

k rel="stylesheet" href="styles.css">

You can read more about file paths in the chapter HTML File Paths.

# **Chapter Summary**

- · Use the HTML style attribute for inline styling
- Use the HTML <style> element to define internal CSS
- Use the HTML link> element to refer to an external CSS file
- Use the HTML <head> element to store <style> and <link> elements
- Use the CSS color property for text colors
- Use the CSS font-family property for text fonts
- Use the CSS font-size property for text sizes
- Use the CSS border property for borders
- Use the CSS padding property for space inside the border
- Use the CSS margin property for space outside the border

Tip: You can learn much more about CSS in our CSS Tutorial.

## **HTML Exercises**

# **HTML Style Tags**

Tag Description

<style> Defines style information for an HTML document

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Links**

Links are found in nearly all web pages. Links allow users to click their way from page to page.

## **HTML Links - Hyperlinks**

HTML links are hyperlinks.

You can click on a link and jump to another document.

When you move the mouse over a link, the mouse arrow will turn into a little hand.

Note: A link does not have to be text. A link can be an image or any other HTML element!

## **HTML Links - Syntax**

The HTML <a> tag defines a hyperlink. It has the following syntax:

<a href="url">link text</a>

The most important attribute of the <a> element is the href attribute, which indicates the link's destination.

The *link text* is the part that will be visible to the reader.

Clicking on the link text, will send the reader to the specified URL address.

## **Example**

This example shows how to create a link to W3Schools.com:

<a href="https://www.w3schools.com/">Visit W3Schools.com!</a>

By default, links will appear as follows in all browsers:

- · An unvisited link is underlined and blue
- · A visited link is underlined and purple
- · An active link is underlined and red

Tip: Links can of course be styled with CSS, to get another look!

# **HTML Links - The target Attribute**

By default, the linked page will be displayed in the current browser window. To change this, you must specify another target for the link.

The target attribute specifies where to open the linked document.

The target attribute can have one of the following values:

- \_self Default. Opens the document in the same window/tab as it was clicked
- \_blank Opens the document in a new window or tab
- \_parent Opens the document in the parent frame
- \_top Opens the document in the full body of the window

#### **Example**

Use target="\_blank" to open the linked document in a new browser window or tab:

## Absolute URLs vs. Relative URLs

Both examples above are using an absolute URL (a full web address) in the href attribute.

A local link (a link to a page within the same website) is specified with a relative URL (without the "https://www" part):

## **Example**

```
<h2>Absolute URLs</h2>
<a href="https://www.w3.org/">W3C</a>
<a href="https://www.google.com/">Google</a>
<h2>Relative URLs</h2>
<a href="html_images.asp">HTML Images</a>
<a href="css/default.asp">CSS Tutorial</a>
```

# HTML Links - Use an Image as a Link

To use an image as a link, just put the <img> tag inside the <a> tag:

## **Example**

```
<a href="default.asp"> <img src="smiley.gif" alt="HTML tutorial" style="width:42px;height:42px;"> </a>
```

## Link to an Email Address

Use mailto: inside the href attribute to create a link that opens the user's email program (to let them send a new email):

#### **Example**

<a href="mailto:someone@example.com">Send email</a>

## **Button as a Link**

To use an HTML button as a link, you have to add some JavaScript code.

JavaScript allows you to specify what happens at certain events, such as a click of a button:

## Example

<button onclick="document.location='default.asp"">HTML Tutorial</button>

Tip: Learn more about JavaScript in our JavaScript Tutorial.

## **Link Titles**

The title attribute specifies extra information about an element. The information is most often shown as a tooltip text when the mouse moves over the element.

## **Example**

<a href="https://www.w3schools.com/html/" title="Go to W3Schools HTML section">Visit our HTML Tutorial</a>

## More on Absolute URLs and Relative URLs

## **Example**

Use a full URL to link to a web page:Â

<a href="https://www.w3schools.com/html/default.asp">HTML tutorial</a>

## **Example**

Link to a page located in the html folder on the current web site:Â

<a href="/html/default.asp">HTML tutorial</a>

## **Example**

Link to a page located in the same folder as the current page:Â

<a href="default.asp">HTML tutorial</a>

You can read more about file paths in the chapter HTML File Paths.

# **Chapter Summary**

- Use the <a> element to define a link
- Use the href attribute to define the link address
- · Use the target attribute to define where to open the linked document
- Use the <img> element (inside <a>) to use an image as a link
- Use the mailto: scheme inside the href attribute to create a link that opens the user's email program

# **HTML Link Tags**

#### Tag Description

<a> Defines a hyperlink

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Links**

Links are found in nearly all web pages. Links allow users to click their way from page to page.

# **HTML Links - Hyperlinks**

HTML links are hyperlinks.

You can click on a link and jump to another document.

When you move the mouse over a link, the mouse arrow will turn into a little hand.

Note: A link does not have to be text. A link can be an image or any other HTML element!

# **HTML Links - Syntax**

The HTML <a> tag defines a hyperlink. It has the following syntax:

<a href="url">link text</a>

The most important attribute of the <a> element is the href attribute, which indicates the link's destination.

The *link text* is the part that will be visible to the reader.

Clicking on the link text, will send the reader to the specified URL address.

This example shows how to create a link to W3Schools.com:

<a href="https://www.w3schools.com/">Visit W3Schools.com!</a>

By default, links will appear as follows in all browsers:

- · An unvisited link is underlined and blue
- · A visited link is underlined and purple
- · An active link is underlined and red

Tip: Links can of course be styled with CSS, to get another look!

## **HTML Links - The target Attribute**

By default, the linked page will be displayed in the current browser window. To change this, you must specify another target for the link.

The target attribute specifies where to open the linked document.

The target attribute can have one of the following values:

- \_self Default. Opens the document in the same window/tab as it was clicked
- \_blank Opens the document in a new window or tab
- \_parent Opens the document in the parent frame
- \_top Opens the document in the full body of the window

## **Example**

Use target="\_blank" to open the linked document in a new browser window or tab:

<a href="https://www.w3schools.com/" target="\_blank">Visit W3Schools!</a>

## Absolute URLs vs. Relative URLs

Both examples above are using an absolute URL (a full web address) in the href attribute.

A local link (a link to a page within the same website) is specified with a relative URL (without the "https://www" part):

## **Example**

```
<h2>Absolute URLs</h2>
<a href="https://www.w3.org/">W3C</a>
<a href="https://www.google.com/">Google</a>
<h2>Relative URLs</h2>
<a href="html_images.asp">HTML Images</a>
<a href="/css/default.asp">CSS Tutorial</a>
```

# HTML Links - Use an Image as a Link

To use an image as a link, just put the <img> tag inside the <a> tag:

## **Example**

```
<a href="default.asp"> <img src="smiley.gif" alt="HTML tutorial" style="width:42px;height:42px;"> </a>
```

## Link to an Email Address

Use mailto: inside the href attribute to create a link that opens the user's email program (to let them send a new email):

#### Example

<a href="mailto:someone@example.com">Send email</a>

## **Button as a Link**

To use an HTML button as a link, you have to add some JavaScript code.

JavaScript allows you to specify what happens at certain events, such as a click of a button:

## **Example**

<button onclick="document.location='default.asp"">HTML Tutorial</button>

Tip: Learn more about JavaScript in our JavaScript Tutorial.

## **Link Titles**

The title attribute specifies extra information about an element. The information is most often shown as a tooltip text when the mouse moves over the element.

## **Example**

<a href="https://www.w3schools.com/html/" title="Go to W3Schools HTML section">Visit our HTML Tutorial</a>

## More on Absolute URLs and Relative URLs

## **Example**

Use a full URL to link to a web page:Â

<a href="https://www.w3schools.com/html/default.asp">HTML tutorial</a>

## **Example**

Link to a page located in the html folder on the current web site:Â

<a href="/html/default.asp">HTML tutorial</a>

## **Example**

Link to a page located in the same folder as the current page:Â

<a href="default.asp">HTML tutorial</a>

You can read more about file paths in the chapter HTML File Paths.

# **Chapter Summary**

- Use the <a> element to define a link
- · Use the href attribute to define the link address
- Use the target attribute to define where to open the linked document
- Use the <img> element (inside <a>) to use an image as a link
- Use the mailto: scheme inside the href attribute to create a link that opens the user's email program

# **HTML Link Tags**

#### Tag Description

<a> Defines a hyperlink</a>

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Links - Different Colors**

An HTML link is displayed in a different color depending on whether it has been visited, is unvisited, or is active.

## **HTML Link Colors**

By default, a link will appear like this (in all browsers):

- · An unvisited link is underlined and blue
- A visited link is underlined and purple
- · An active link is underlined and red

You can change the link state colors, by using CSS:

## **Example**

Here, an unvisited link will be green with no underline. A visited link will be pink with no underline. An active link will be yellow and underlined. In addition, when mousing over a link (a:hover) it will become red and underlined:

```
<style>
a:link {
 Â color: green;
À À background-color: transparent;
 Â text-decoration: none;
a:visited {
A color: pink;
A background-color: transparent;
A text-decoration: none;
}
a:hover {
 color: red;
A background-color: transparent;
A text-decoration: underline;
}
a:active {
 color: yellow;
A background-color: transparent;
A text-decoration: underline;
</style>
```

## **Link Buttons**

A link can also be styled as a button, by using CSS:

This is a link

```
<style>
a:link, a:visited {
 background-color: #f44336;
 color: white;
 padding: 15px 25px;
 text-align: center;
 text-decoration: none;
 display: inline-block;
}
a:hover, a:active {
 background-color: red;
```

```
}
</style>
```

To learn more about CSS, go to our CSS Tutorial.

# **HTML Link Tags**

Tag Description

<a> Defines a hyperlink

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Links - Create Bookmarks**

HTML links can be used to create bookmarks, so that readers can jump to specific parts of a web page.

## Create a Bookmark in HTML

Bookmarks can be useful if a web page is very long.

To create a bookmark - first create the bookmark, then add a link to it.

When the link is clicked, the page will scroll down or up to the location with the bookmark.

## **Example**

First, use the id attribute to create a bookmark:

<h2 id="C4">Chapter 4</h2>

Then, add a link to the bookmark ("Jump to Chapter 4"), from within the same page:

## Example

<a href="#C4">Jump to Chapter 4</a>

You can also add a link to a bookmark on another page:

<a href="html\_demo.html#C4">Jump to Chapter 4</a>

# **Chapter Summary**

- Use the id attribute (id="value") to define bookmarks in a page
- Use the href attribute (href="#value") to link to the bookmark

## **HTML Exercises**

# **HTML Link Tags**

Tag Description

<a> Defines a hyperlink

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Images**

| Images can improve the design and the appearance of a web page. |
|---|
|---|

# Example

<img src="pic\_trulli.jpg" alt="Italian Trulli">

# Example

<img src="img\_girl.jpg" alt="Girl in a jacket">

# Example

<img src="img\_chania.jpg" alt="Flowers in Chania">

# **HTML Images Syntax**

The HTML <img> tag is used to embed an image in a web page.

Images are not technically inserted into a web page; images are linked to web pages. The <img> tag creates a holding space for the referenced image.

The <img> tag is empty, it contains attributes only, and does not have a closing tag.

The <img> tag has two required attributes:

- · src Specifies the path to the image
- · alt Specifies an alternate text for the image

## **Syntax**

<img src="url" alt="alternatetext">

## The src Attribute

The required src attribute specifies the path (URL) to the image.

**Note:** When a web page loads; it is the browser, at that moment, that gets the image from a web server and inserts it into the page. Therefore, make sure that the image actually stays in the same spot in relation to the web page, otherwise your visitors will get a broken link icon. The broken link icon and the alt text are shown if the browser cannot find the image.

## **Example**

<img src="img\_chania.jpg" alt="Flowers in Chania">

## The alt Attribute

The required alt attribute provides an alternate text for an image, if the user for some reason cannot view it (because of slow connection, an error in the src attribute, or if the user uses a screen reader).

The value of the alt attribute should describe the image:

## **Example**

<img src="img chania.jpg" alt="Flowers in Chania">

If a browser cannot find an image, it will display the value of thealt attribute:

## **Example**

<img src="wrongname.gif" alt="Flowers in Chania">

**Tip:** A screen reader is a software program that reads the HTML code, and allows the user to "listen" to the content. Screen readers are useful for people who are visually impaired or learning disabled.

# Image Size - Width and Height

You can use the style attribute to specify the width and height of an image.

#### **Example**

<img src="img\_girl.jpg" alt="Girl in a jacket" style="width:500px;height:600px;">

Alternatively, you can use the width and height attributes:

## **Example**

<img src="img\_girl.jpg" alt="Girl in a jacket" width="500" height="600">

The width and height attributes always define the width and height of the image in pixels.

**Note:** Always specify the width and height of an image. If width and height are not specified, the web page might flicker while the image loads.

## Width and Height, or Style?

The width, height, and style attributes are all valid in HTML.

However, we suggest using the style attribute. It prevents styles sheets from changing the size of images:

## **Example**

```
<!DOCTYPE html>
<html>
<head>
<style>
img {
    Â Â width: 100%;
}
</style>
</head>
<body>
<img src="html5.gif" alt="HTML5 lcon" width="128" height="128">
<img src="html5.gif" alt="HTML5 lcon" style="width:128px;height:128px;">
</body>
</html>
```

## Images in Another Folder

If you have your images in a sub-folder, you must include the folder name in the src attribute:

## **Example**

<img src="/images/html5.gif" alt="HTML5 lcon" style="width:128px;height:128px;">

# Images on Another Server/Website

Some web sites point to an image on another server.

To point to an image on another server, you must specify an absolute (full) URL in the src attribute:

## **Example**

<img src="https://www.w3schools.com/images/w3schools\_green.jpg" alt="W3Schools.com">

**Notes on external images:** External images might be under copyright. If you do not get permission to use it, you may be in violation of copyright laws. In addition, you cannot control external images; it can suddenly be removed or changed.

# **Animated Images**

HTML allows animated GIFs:

## Example

<img src="programming.gif" alt="Computer Man" style="width:48px;height:48px;">

# Image as a Link

To use an image as a link, put the <img> tag inside the <a> tag:

```
<a href="default.asp"> 
 <img src="smiley.gif" alt="HTML tutorial" style="width:42px;height:42px;">
```

# **Image Floating**

Use the CSS float property to let the image float to the right or to the left of a text:

## **Example**

<img src="smiley.gif" alt="Smiley face" style="float:right;width:42px;height:42px;"> The image will float to the right of the text.

<img src="smiley.gif" alt="Smiley face" style="float:left;width:42px;height:42px;"> The image will float to the left of the text.

Tip: To learn more about CSS Float, read our CSS Float Tutorial.

# **Common Image Formats**

Here are the most common image file types, which are supported in all browsers (Chrome, Edge, Firefox, Safari, Opera):

Abbreviation	n File Format	File Extension
APNG	Animated Portable Network Graphics	.apng
GIF	Graphics Interchange Format	.gif
ICO	Microsoft Icon	.ico, .cur
JPEG	Joint Photographic Expert Group image	.jpg, .jpeg, .jfif, .pjpeg, .pjp
PNG	Portable Network Graphics	.png
SVG	Scalable Vector Graphics	.svg

# **Chapter Summary**

- Use the HTML <img> element to define an image
- Use the HTML src attribute to define the URL of the image
- Use the HTML alt attribute to define an alternate text for an image, if it cannot be displayed
- Use the HTML width and height attributes or the CSS width and height properties to define the size of the image
- Use the CSS float property to let the image float to the left or to the right

Note: Loading large images takes time, and can slow down your web page. Use images carefully.

## **HTML Exercises**

# **HTML Image Tags**

Tag	Description
<u><img/></u>	Defines an image
<map></map>	Defines an image map
<area/>	Defines a clickable area inside an image map
<picture></picture>	Defines a container for multiple image resources
	resources

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Image Maps**

With HTML image maps, you can create clickable areas on an image.

# **Image Maps**

The HTML <map> tag defines an image map. An image map is an image with clickable areas. The areas are defined with one or more <area> tags.

Try to click on the computer, phone, or the cup of coffee in the image below:

## Example

Here is the HTML source code for the image map above:

<img src="workplace.jpg" alt="Workplace" usemap="#workmap">

<map name="workmap">

<area shape="rect" coords="34,44,270,350" alt="Computer" href="computer.htm">

<area shape="rect" coords="290,172,333,250" alt="Phone" href="phone.htm">

<area shape="circle" coords="337,300,44" alt="Coffee" href="coffee.htm">

</map>

## **How Does it Work?**

The idea behind an image map is that you should be able to perform different actions depending on where in the image you click.

To create an image map you need an image, and some HTML code that describes the clickable areas.

## The Image

The image is inserted using the <img> tag. The only difference from other images is that you must add a usemap attribute:

<img src="workplace.jpg" alt="Workplace" usemap="#workmap">

The usemap value starts with a hash tag# followed by the name of the image map, and is used to create a relationship between the image and the image map.

Tip: You can use any image as an image map!

# **Create Image Map**

Then, add a <map> element.

The <map> element is used to create an image map, and is linked to the image by using the required name attribute:

<map name="workmap">

The name attribute must have the same value as the <img>'s usemap attribute.

## The Areas

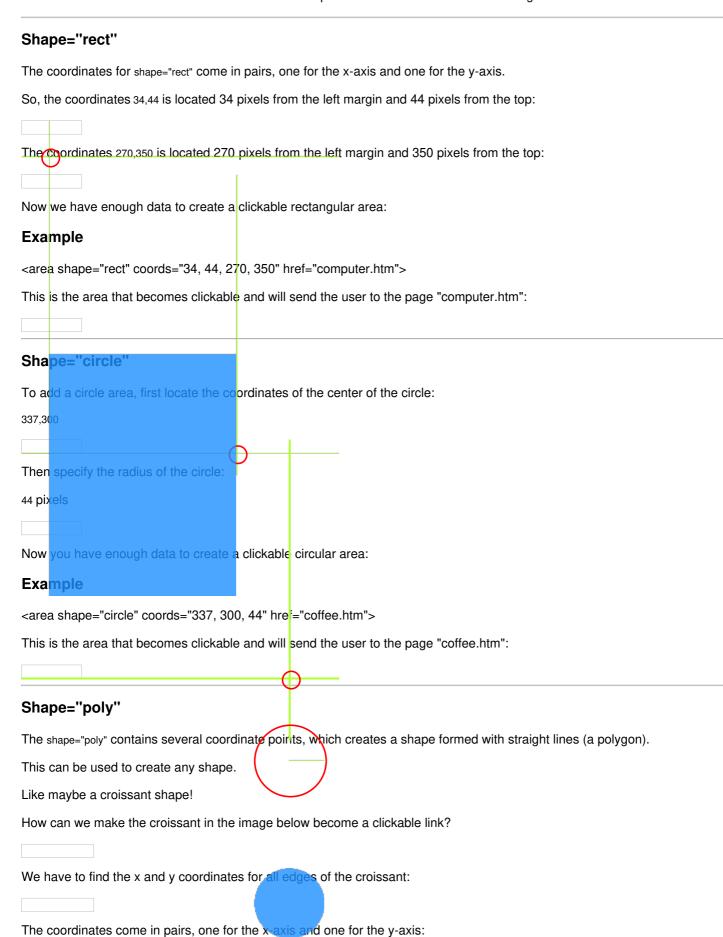

Then, add the clickable areas.

A clickable area is defined using an <area> element.

#### Shape

You must define the shape of the clickable area, and you can choose one of these values:

- rect defines a rectangular region
- circle defines a circular region
- · poly defines a polygonal region
- · default defines the entire region

Example

<area shape="poly"
coords="140,121,181,116,204,160,204,222,191,270,140,329,85,355,58,352,37,322,40,259,103,161,128,147"
href="croissant.htm">

This is the area that becomes clickable and will send the user to the page "croissant.htm":

# Image Map and JavaScript

A clickable area can also trigger a JavaScript function.

Add a click event to the <area> element to execute a JavaScript function:

## **Example**

Here, we use the onclick attribute to execute a JavaScript function when the area is clicked:

```
<map name="workmap">
 <area shape="circle" coords="337,300,44" href="coffee.htm" onclick="myFunction()">
</map>
<script>
function myFunction() {
 alert("You clicked the coffee cup!");
}
</script>
```

# **Chapter Summary**

- Use the HTML <map> element to define an image map
- Use the HTML <area> element to define the clickable areas in the image map
- Use the HTML usemap attribute of the <img> element to point to an image map

# **HTML Image Tags**

Tag	Description
<u><img/></u>	Defines an image
<map></map>	Defines an image map
<area/>	Defines a clickable area inside an image map
<picture></picture>	Defines a container for multiple image resources

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Background Images**

A background image can be specified for almost any HTML element.

# Background Image on a HTML element

To add a background image on an HTML element, use the HTML style attribute and the CSS background-image property:

## **Example**

Add a background image on a HTML element:

```
<div style="background-image: url('img_girl.jpg');">
```

You can also specify the background image in the <style> element, in the <head> section:

Specify the background image in the <style> element:

```
<style>
div {
    Â background-image: url('img_girl.jpg');
}
</style>
```

# **Background Image on a Page**

If you want the entire page to have a background image, you must specify the background image on the <body> element:

## **Example**

Add a background image for the entire page:

```
<style>
body {
 background-image: url('img_girl.jpg');
}
</style>
```

## **Background Repeat**

If the background image is smaller than the element, the image will repeat itself, horizontally and vertically, until it reaches the end of the element:

## **Example**

```
<style>
body {
 background-image: url('example_img_girl.jpg');
}
</style>
```

To avoid the background image from repeating itself, set thebackground-repeat property to no-repeat.

## **Example**

```
<style>
body {
 background-image: url('example_img_girl.jpg');
 background-repeat: no-repeat;
}
</style>
```

# **Background Cover**

If you want the background image to cover the entire element, you can set the background-size property to cover.

Also, to make sure the entire element is always covered, set the background-attachment property to fixed:

This way, the background image will cover the entire element, with no stretching (the image will keep its original proportions):

## **Example**

```
<style>
body {
A background-image: url('img_girl.jpg');
A background-repeat: no-repeat;
A background-attachment: fixed;
A background-size: cover;
</style>
```

# **Background Stretch**

If you want the background image to stretch to fit the entire element, you can set the background-size property to 100% 100%:

Try resizing the browser window, and you will see that the image will stretch, but always cover the entire element.

#### **Example**

```
<style>
body {
A background-image: url('img_girl.jpg');
A background-repeat: no-repeat;
A background-attachment: fixed;
A background-size: 100% 100%;
</style>
```

## Learn More CSS

From the examples above you have learned that background images can be styled by using the CSS background properties.

To learn more about CSS background properties, study our CSS Background Tutorial.

# **HTML <picture> Element**

The HTML <picture> element allows you to display different pictures for different devices or screen sizes.

# The HTML <picture> Element

The HTML <picture> element gives web developers more flexibility in specifying image resources.

The <picture> element contains one or more <source> elements, each referring to different images through the srcset attribute. This way the browser can choose the image that best fits the current view and/or device.

Each <source> element has a media attribute that defines when the image is the most suitable.

## Example

Show different images for different screen sizes:

```
<picture>
 <source media="(min-width: 650px)" srcset="img_food.jpg">
 <source media="(min-width: 465px)" srcset="img_car.jpg">
 <img src="img_girl.jpg">
</picture>
```

**Note:** Always specify an <img> element as the last child element of the <picture> element. The <img> element is used by browsers that do not support the <picture> element, or if none of the<source> tags match.

## When to use the Picture Element

There are two main purposes for the <picture> element:

#### 1. Bandwidth

If you have a small screen or device, it is not necessary to load a large image file. The browser will use the first <source> element with matching attribute values, and ignore any of the following elements.

## 2. Format Support

Some browsers or devices may not support all image formats. By using the picture element, you can add images of all formats, and the browser will use the first format it recognizes, and ignore any of the following elements.

## Example

The browser will use the first image format it recognizes:

```
<picture>
 <source srcset="img_avatar.png">
 <source srcset="img_girl.jpg">
 <img src="img_beatles.gif" alt="Beatles" style="width:auto;">
</picture>
```

**Note:** The browser will use the first <source> element with matching attribute values, and ignore any following <source> elements.

# **HTML Image Tags**

Tag	Description
<img/>	Defines an image
<map></map>	Defines an image map
<area/>	Defines a clickable area inside an image map
<nicture></nicture>	Defines a container for multiple image resources
<u> </u>	resources

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Tables**

## **Example**

Company	Contact	Country
Alfreds Futterkiste	Maria Anders	Germany
Centro comercial Moctezuma	Francisco Chang	Mexico
Ernst Handel	Roland Mendel	Austria
Island Trading	Helen Bennett	UK
Laughing Bacchus Winecellars	Yoshi Tannamuri	Canada
Magazzini Alimentari Riuniti	Giovanni Rovelli	Italy

## **Define an HTML Table**

The tag defines an HTML table.

Each table row is defined with a 
 tag. Each table header is defined with a tag. Each table data/cell is defined with a tag.

By default, the text in > elements are bold and centered.

By default, the text in elements are regular and left-aligned.

## **Example**

```
A simple HTML table:
```

```
 
ÂÂÂ Firstname
ÂÂÂ Lastname
ÂÂÂ Age

Â Jill
ÂÂÂ Smith
 Â Â 50
 
 
ÂÂÂ Eve
ÂÂÂ Jackson
\hat{A} \hat{A} \hat{A}  94
```

Note: The elements are the data containers of the table.

They can contain all sorts of HTML elements; text, images, lists, other tables, etc.

## HTML Table - Add a Border

To add a border to a table, use the CSSborder property:

## **Example**

```
table, th, td { \hat{A} \hat{A} border: 1px solid black; }
```

Remember to define borders for both the table and the table cells.

# **HTML Table - Collapsed Borders**

To let the borders collapse into one border, add the CSSborder-collapse property:

## **Example**

```
table, th, td {
    Â Â border: 1px solid black;
    Â border-collapse: collapse;
}
```

# **HTML Table - Add Cell Padding**

Cell padding specifies the space between the cell content and its borders.

If you do not specify a padding, the table cells will be displayed without padding.

To set the padding, use the CSSpadding property:

## **Example**

```
th, td { Â padding: 15px; }
```

# **HTML Table - Left-align Headings**

By default, table headings are bold and centered.

To left-align the table headings, use the CSS text-align property:

## Example

```
th { Â Â text-align: left; }
```

# **HTML Table - Add Border Spacing**

Border spacing specifies the space between the cells.

To set the border spacing for a table, use the CSSborder-spacing property:

## Example

```
table {
 border-spacing: 5px;
}
```

Note: If the table has collapsed borders, border-spacing has no effect.

# **HTML Table - Cell that Spans Many Columns**

To make a cell span more than one column, use thecolspan attribute:

# **HTML Table - Cell that Spans Many Rows**

To make a cell span more than one row, use therowspan attribute:

## **Example**

```
\hat{A} 
\hat{A} 
\hat{A} \hat{A} Name:
\hat{A} \hat{A} A in Gates

\hat{A} 
\hat{A} 
\hat{A} 
\hat{A} 
\hat{A} Telephone:

\hat{A} A in Gates

\hat{A} A in Gates

\hat{A} 
\hat{A} < A in Gates</td>

\hat{A} A in Gates

\hat{A} A in Gates
```

# **HTML Table - Add a Caption**

To add a caption to a table, use the <caption> tag:

## **Example**

```
 <caption>Monthly savings</caption>
 
 Â Â Month

 Â Â Savings

 A Â <ttr>
 
 Â A January

 Â Â $100

 
 Â A $100

 
 A A $100

 
 A A $100

 A A $100

A A A $100

B A A $100

B A A $100

B A A A $100

B A A A $100

B A A $100
```

Note: The <caption> tag must be inserted immediately after the tag.

# A Special Style for One Table

To define a special style for one particular table, add an id attribute to the table:

## Now you can define a special style for this table:

```
 Â background-color: #f1f1c1;
}

And add more styles:

#t01 tr:nth-child(even) {
 Â background-color: #eee;
}

#t01 tr:nth-child(odd) {
 Â background-color: #fff;
}

#t01 th {
 Â color: white;
 Â background-color: black;
}
```

#t01 {

Â width: 100%;

# **Chapter Summary**

- Use the HTML element to define a table
- Use the HTML 
   element to define a table row
- Use the HTML element to define a table data
- Use the HTML element to define a table heading
- Use the HTML <caption> element to define a table caption
- Use the CSS border property to define a border
- Use the CSS border-collapse property to collapse cell borders
- Use the CSS padding property to add padding to cells
- Use the CSS text-align property to align cell text
- Use the CSS border-spacing property to set the spacing between cells
- Use the colspan attribute to make a cell span many columns
- Use the rowspan attribute to make a cell span many rows
- Use the id attribute to uniquely define one table

## **HTML Exercises**

# **HTML Table Tags**

Tag	Description
	Defines a table
<u></u>	Defines a header cell in a table
<u></u>	Defines a row in a table
<u></u> >	Defines a cell in a table
<caption></caption>	Defines a table caption
<colgroup></colgroup>	Specifies a group of one or more columns in a table for formatting
<u><col/></u>	Specifies column properties for each column within a <colgroup> element</colgroup>
<thead></thead>	Groups the header content in a table
	Groups the body content in a table
<tfoot></tfoot>	Groups the footer content in a table

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Lists**

HTML lists allow web developers to group a set of related items in lists.

## **Example**

An unordered HTML list:

- Item
- Item
- Item
- Item

An ordered HTML list:

- 1. First item
- 2. Second item
- 3. Third item
- 4. Fourth item

## **Unordered HTML List**

An unordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with bullets (small black circles) by default:

## **Example**

Coffee

Tea

Milk

## **Ordered HTML List**

An ordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with numbers by default:

## **Example**

<0|>

Coffee

Tea

Milk

</01>

# **HTML Description Lists**

HTML also supports description lists.

A description list is a list of terms, with a description of each term.

The <dl> tag defines the description list, the <dt> tag defines the term (name), and the <dd> tag describes each term:

## **Example**

< dl >

<dt>Coffee</dt>

<dd>- black hot drink</dd>

<dt>Milk</dt>

<dd>- white cold drink</dd>

</dl>

# **HTML List Tags**

# Tag Description Defines an unordered list Defines an ordered list ≥ Defines a list item <dl>> Defines a description list <dt>Defines a term in a description list Describes the term in a description

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Lists**

HTML lists allow web developers to group a set of related items in lists.

## **Example**

An unordered HTML list:

- Item
- Item
- Item
- Item

An ordered HTML list:

- 1. First item
- 2. Second item
- 3. Third item
- 4. Fourth item

## **Unordered HTML List**

An unordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with bullets (small black circles) by default:

## **Example**

Â Coffee
 Â Tea
 Â Milk

## **Ordered HTML List**

An ordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with numbers by default:

## **Example**

Â Coffee
 Â Tea
 Â Milk

# **HTML Description Lists**

HTML also supports description lists.

A description list is a list of terms, with a description of each term.

The <dl> tag defines the description list, the <dt> tag defines the term (name), and the <dd> tag describes each term:

## **Example**

<dl>

<dt>Coffee</dt>

<dd>- black hot drink</dd>

 $\hat{A} < dt > Milk < /dt >$ 

<dd>- white cold drink</dd>

</dl>

## **HTML List Tags**

# Tag Description Defines an unordered list Defines an ordered list Defines a list item Defines a description list Defines a term in a description list >ul> >ul> Ul> Ul> Ul> Ul> Ul>

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Unordered Lists**

The HTML tag defines an unordered (bulleted) list.

## Unordered HTML List

An unordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with bullets (small black circles) by default:

## **Example**

Coffee

Tea

Milk

## Unordered HTML List - Choose List Item Marker

The CSS list-style-type property is used to define the style of the list item marker. It can have one of the following values:

## Value Description

disc Sets the list item marker to a bullet

(default)

circle Sets the list item marker to a circle square Sets the list item marker to a square

## **Example - Disc**

Coffee Tea Milk

## **Example - Circle**

Coffee Tea Milk

## **Example - Square**

Coffee Tea Milk

## **Example - None**

 Â Coffee
 Â Tea
 A Milk

 <l>

 <l>

## **Nested HTML Lists**

Lists can be nested (list inside list):

## **Example**

Note: A list item () can contain a new list, and other HTML elements, like images and links, etc.

## **Horizontal List with CSS**

HTML lists can be styled in many different ways with CSS.

One popular way is to style a list horizontally, to create a navigation menu:

## **Example**

<!DOCTYPE html> <html> <head> <style>

```
ul {
 list-style-type: none;
 margin: 0;
 padding: 0;
 Â overflow: hidden;
 Â background-color: #333333;
 Â float: left;
li a {
 Â display: block;
 Â color: white;
 Â text-align: center;
 Â padding: 16px;
A text-decoration: none;
li a:hover {
 Â background-color: #111111;
</style>
</head>
<body>
ul>
 <a href="#home">Home</a>
\hat{A} <a href="#news">News</a>
 <a href="#contact">Contact</a>
 <a href="#about">About</a>
</body>
</html>
```

Tip: You can learn much more about CSS in our CSS Tutorial.

# **Chapter Summary**

- Use the HTML element to define an unordered list
- Use the CSS list-style-type property to define the list item marker
- Use the HTML element to define a list item
- · Lists can be nested
- · List items can contain other HTML elements
- Use the CSS property float:left to display a list horizontally

# **HTML List Tags**

```
Tag Description

    U≥ Defines an unordered list
    O≥ Defines an ordered list
    U≥ Defines a list item
    O≥ Defines a description list
    Defines a term in a description list
    Describes the term in a description list
```

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Ordered Lists**

The HTML tag defines an ordered list. An ordered list can be numerical or alphabetical.

## **Ordered HTML List**

An ordered list starts with the tag. Each list item starts with the tag.

The list items will be marked with numbers by default:

## **Example**

<0|>

Coffee

Tea

Milk

</01>

# **Ordered HTML List - The Type Attribute**

The type attribute of the tag, defines the type of the list item marker:

## Type Description

type="1" The list items will be numbered with numbers (default)

type="A" The list items will be numbered with uppercase letters

type="a" The list items will be numbered with lowercase letters

type="I" The list items will be numbered with uppercase roman numbers

type="i" The list items will be numbered with lowercase roman numbers

#### **Numbers:**

type="1">

Coffee

Tea

Milk

## **Uppercase Letters:**

Coffee

Tea

Milk

</01>

#### **Lowercase Letters:**

Coffee

Tea

Milk

</01>

## **Uppercase Roman Numbers:**

type="l">

Coffee

Tea

Milk

</01>

#### **Lowercase Roman Numbers:**

 Coffee Tea Milk

# **Control List Counting**

By default, an ordered list will start counting from 1. If you want to start counting from a specified number, you can use the start attribute:

## **Example**

 Coffee Tea Milk

## **Nested HTML Lists**

Lists can be nested (list inside list):

## **Example**

 Â Coffee
 Â Tea
 Â Â Â < col>
 Â Â Â Â A Black tea
 Â Â Â Â A Green tea
 Â A Â A 
 Â 
 A Milk

Note: A list item (<ii>) can contain a new list, and other HTML elements, like images and links, etc.

# **Chapter Summary**

- Use the HTML element to define an ordered list
- Use the HTML type attribute to define the numbering type
- Use the HTML element to define a list item
- · Lists can be nested
- · List items can contain other HTML elements

# **HTML List Tags**

# Tag Description □ Defines an unordered list □ Defines an ordered list □ Defines a list item □ Defines a description list □ Defines a term in a description list □ Describes the term in a description list □ Describes the term in a description list

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Other Lists**

HTML also supports description lists.

## **HTML Description Lists**

A description list is a list of terms, with a description of each term.

The <dl> tag defines the description list, the <dl> tag defines the term (name), and the <dd> tag describes each term:

## **Example**

<dl>

<dt>Coffee</dt>

<dd>- black hot drink</dd>

 $\hat{A} < dt > Milk < /dt >$ 

<dd>- white cold drink</dd>

</dl>

# **Chapter Summary**

- Use the HTML <dl> element to define a description list
- Use the HTML <dt> element to define the description term
- Use the HTML <dd> element to describe the term in a description list

## **HTML Exercises**

# **HTML List Tags**

## Tag Description

ul> Defines an unordered list

Defines an ordered list

Defines a list item

<dl> Defines a description list

dt> Defines a term in a description list

Describes the term in a description

<dd>list

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Block and Inline Elements**

Every HTML element has a default display value, depending on what type of element it is.

There are two display values: block and inline.

## **Block-level Elements**

A block-level element always starts on a new line.

A block-level element always takes up the full width available (stretches out to the left and right as far as it can).

A block level element has a top and a bottom margin, whereas an inline element does not.

The <div> element is a block-level element.

## **Example**

<div>Hello World</div>

Here are the block-level elements in HTML:

<address>

<article>

<aside>

<blook<br/>duote>

<canvas>

<u><dd>></u>

<div>

<u><dl></u>

<u><dt></u>

<fieldset>

<figcaption>

<figure>

<footer>

<form>

<h1>-<h6>

<header>

<u><hr></u>

<u>></u>

<main>

<nav>

<noscript>

<u><0|></u>

<u></u>

<section>

<tfoot>

<u></u>

<video>

## **Inline Elements**

An inline element does not start on a new line.

An inline element only takes up as much width as necessary.

This is a <span> element inside a paragraph.

## **Example**

<span>Hello World</span>

Here are the inline elements in HTML:

<u><a>></u>

<abbr>

<acronym>

<u><b></u>

<bdo> <big> <br> <but> <cite> <code> <dfn> <em> <u><i>≥</u> <img> <input> <kbd> <label> <map> <object> <output> <q> <samp> <script> <select> <small> <span> <strong> <sub> <sup> <textarea> <time> <tt>

Note: An inline element cannot contain a block-level element!

## The <div> Element

The <div> element is often used as a container for other HTML elements.

The <div> element has no required attributes, but style, class and id are common.

When used together with CSS, the <div> element can be used to style blocks of content:

## **Example**

<var>

<div style="background-color:black;color:white;padding:20px;">

<h2>London</h2>

London is the capital city of England. It is the most populous city in the United Kingdom, with a metropolitan area of over 13 million inhabitants.

# The <span> Element

The <span> element is an inline container used to mark up a part of a text, or a part of a document.

The <span> element has no required attributes, but style, class and id are common.

When used together with CSS, the <span> element can be used to style parts of the text:

My mother has <span style="color:blue;font-weight:bold">blue</span> eyes and my father has <span style="color:darkolivegreen;font-weight:bold">dark green</span> eyes.

### **Chapter Summary**

- There are two display values: block and inline
- A block-level element always starts on a new line and takes up the full width available
- An inline element does not start on a new line and it only takes up as much width as necessary
- The <div> element is a block-level and is often used as a container for other HTML elements
- The <span> element is an inline container used to mark up a part of a text, or a part of a document

### **HTML Tags**

# Tag Description <div> Defines a section in a document (block-level) <span> Defines a section in a document (inline)

For a complete list of all available HTML tags, visit our HTML Tag Reference.

### **HTML class Attribute**

The HTML class attribute is used to specify a class for an HTML element.

Multiple HTML elements can share the same class.

### **Using The class Attribute**

The class attribute is often used to point to a class name in a style sheet. It can also be used by a JavaScript to access and manipulate elements with the specific class name.

In the following example we have three<div> elements with a class attribute with the value of "city". All of the three <div> elements will be styled equally according to the .city style definition in the head section:

```
<!DOCTYPE html>
<html>
<head>
<style>
.city {
 Â background-color: tomato;
A color: white;
A border: 2px solid black;
A margin: 20px;
A padding: 20px;
</style>
</head>
<body>
<div class="city">
 <h2>London</h2>
 London is the capital of England.
</div>
<div class="city">
 <h2>Paris</h2>
 Paris is the capital of France.
</div>
```

```
<div class="city">
 <h2>Tokyo</h2>
 Tokyo is the capital of Japan.
</div>
</body>
</html>
```

In the following example we have two<span> elements with a class attribute with the value of "note". Both <span> elements will be styled equally according to the .note style definition in the head section:

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
<style>
.note {
 font-size: 120%;
 Â color: red;
}
</style>
</head>
<body>
<h1>My <span class="note">Important</span> Heading</h1>
This is some <span class="note">important</span> text.
</body>
</html>
```

Tip: The class attribute can be used on any HTML element.

Note: The class name is case sensitive!

Tip: You can learn much more about CSS in our CSS Tutorial.

### The Syntax For Class

To create a class; write a period (.) character, followed by a class name. Then, define the CSS properties within curly braces {}:

```
Create a class named "city":
<!DOCTYPE html>
<html>
<head>
<style>
.city {
A background-color: tomato;
A color: white;
A padding: 10px;
</style>
</head>
<body>
<h2 class="city">London</h2>
London is the capital of England.
<h2 class="city">Paris</h2>
Paris is the capital of France.
<h2 class="city">Tokyo</h2>
Tokyo is the capital of Japan.
```

### **Multiple Classes**

HTML elements can belong to more than one class.

To define multiple classes, separate the class names with a space, e.g. <div class="city main">. The element will be styled according to all the classes specified.

In the following example, the first <h2> element belongs to both the city class and also to the main class, and will get the CSS styles from both of the classes:Â

#### **Example**

```
<h2 class="city main">London</h2>
<h2 class="city">Paris</h2>
<h2 class="city">Tokyo</h2>
```

#### **Different Elements Can Share Same Class**

Different HTML elements can point to the same class name.

In the following example, both <h2> and points to the "city" class and will share the same style:

#### **Example**

```
<h2 class="city">Paris</h2>
Paris is the capital of France
```

### Use of The class Attribute in JavaScript

The class name can also be used by JavaScript to perform certain tasks for specific elements.

JavaScript can access elements with a specific class name with thegetElementsByClassName() method:

#### **Example**

Click on a button to hide all elements with the class name "city":

```
<script>
function myFunction() {
 var x = document.getElementsByClassName("city");
 for (var i = 0; i < x.length; i++) {
 Â Â x[i].style.display = "none";
 }
}
</script>
```

Don't worry if you don't understand the code in the example above.

You will learn more about JavaScript in our HTML JavaScript chapter, or you can study our JavaScript Tutorial.

### **Chapter Summary**

- The HTML class attribute specifies one or more class names for an element
- Classes are used by CSS and JavaScript to select and access specific elements
- The class attribute can be used on any HTML element
- The class name is case sensitive
- · Different HTML elements can point to the same class name
- JavaScript can access elements with a specific class name with thegetElementsByClassName() method

#### **HTML Exercises**

### **HTML** id Attribute

The HTML id attribute is used to specify a unique id for an HTML element.

You cannot have more than one element with the same id in an HTML document.

### **Using The id Attribute**

The id attribute specifies a unique id for an HTML element. The value of the id attribute must be unique within the HTML document.

The id attribute is used to point to a specific style declaration in a style sheet. It is also used by JavaScript to access and manipulate the element with the specific id.

The syntax for id is: write a hash character (#), followed by an id name. Then, define the CSS properties within curly braces {}.

In the following example we have an<h1> element that points to the id name "myHeader". This <h1> element will be styled according to the #myHeader style definition in the head section:

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
<style>
#myHeader {
 background-color: lightblue;
 color: black;
 padding: 40px;
 text-align: center;
}
</style>
</head>
<body>
<h1 id="myHeader">My Header</h1>
</body>
</html>
```

Note: The id name is case sensitive!

**Note:** The id name must contain at least one character, cannot start with a number, and must not contain whitespaces (spaces, tabs, etc.).

#### Difference Between Class and ID

A class name can be used by multiple HTML elements, while an id name must only be used by one HTML element within the page:

```
<style>
/* Style the element with the id "myHeader" */
#myHeader {
 background-color: lightblue;
 color: black;
 Â padding: 40px;
 Â text-align: center;
}
/* Style all elements with the class name "city" */
```

```
.city {
 background-color: tomato;
 Â color: white;
 Â padding: 10px;
}
</style>
<!-- An element with a unique id -->
<h1 id="myHeader">My Cities</h1>
<!-- Multiple elements with same class -->
<h2 class="city">London</h2>
London is the capital of England.
<h2 class="city">Paris</h2>
Paris is the capital of France.
<h2 class="city">Tokyo</h2>
Time You can learn much more shout CCC in our CCC Tutorio
```

Tip: You can learn much more about CSS in our CSS Tutorial.

#### **HTML Bookmarks with ID and Links**

HTML bookmarks are used to allow readers to jump to specific parts of a webpage.

Bookmarks can be useful if your page is very long.

To use a bookmark, you must first create it, and then add a link to it.

Then, when the link is clicked, the page will scroll to the location with the bookmark.

### **Example**

```
First, create a bookmark with theid attribute:
```

```
<h2 id="C4">Chapter 4</h2>
```

Then, add a link to the bookmark ("Jump to Chapter 4"), from within the same page:

#### **Example**

```
<a href="#C4">Jump to Chapter 4</a>
```

Or, add a link to the bookmark ("Jump to Chapter 4"), from another page:

<a href="html\_demo.html#C4">Jump to Chapter 4</a>

### Using The id Attribute in JavaScript

The id attribute can also be used by JavaScript to perform some tasks for that specific element.

JavaScript can access an element with a specific id with thegetElementByld() method:

#### **Example**

Use the id attribute to manipulate text with JavaScript:

```
<script>
function displayResult() {
  Â Â document.getElementById("myHeader").innerHTML = "Have a nice day!";
}
</script>
```

Tip: Study JavaScript in the HTML JavaScript chapter, or in our JavaScript Tutorial.

### **Chapter Summary**

- The id attribute is used to specify a unique id for an HTML element
- The value of the id attribute must be unique within the HTML document
- The id attribute is used by CSS and JavaScript to style/select a specific element
- The value of the id attribute is case sensitive
- The id attribute is also used to create HTML bookmarks
- JavaScript can access an element with a specific id with thegetElementByld() method

_	IΤN	/ 1	LVC	rcis	00

### **HTML Iframes**

n HTML iframe is used to display a web page within a web page.					

### **HTML Iframe Syntax**

The HTML <iframe> tag specifies an inline frame.

An inline frame is used to embed another document within the current HTML document.

#### **Syntax**

<iframe src="url" title="description"></iframe>

**Tip:** It is a good practice to always include atitle attribute for the <iframe>. This is used by screen readers to read out what the content of the iframe is.

# Iframe - Set Height and Width

Use the height and width attributes to specify the size of the iframe.

The height and width are specified in pixels by default:

#### **Example**

<iframe src="demo\_iframe.htm" height="200" width="300" title="Iframe Example"></iframe>

Or you can add the style attribute and use the CSS height and width properties:

#### **Example**

<iframe src="demo\_iframe.htm" style="height:200px;width:300px;" title="lframe Example"></iframe>

#### Iframe - Remove the Border

By default, an iframe has a border around it.

To remove the border, add the style attribute and use the CSS border property:

#### **Example**

<iframe src="demo\_iframe.htm" style="border:none;" title="lframe Example"></iframe>

With CSS, you can also change the size, style and color of the iframe's border:

#### **Example**

<iframe src="demo\_iframe.htm" style="border:2px solid red;" title="Iframe Example"></iframe>

### Iframe - Target for a Link

An iframe can be used as the target frame for a link.

The target attribute of the link must refer to the name attribute of the iframe:

#### **Example**

<iframe src="demo\_iframe.htm" name="iframe\_a" title="Iframe Example"></iframe>

<a href="https://www.w3schools.com" target="iframe\_a">W3Schools.com</a>

### **Chapter Summary**

- The HTML <iframe> tag specifies an inline frame
- The src attribute defines the URL of the page to embed
- · Always include a title attribute (for screen readers)
- The height and width attributes specifies the size of the iframe
- Use border:none; to remove the border around the iframe

#### **HTML Exercises**

### **HTML** iframe Tag

Tag Description

<iframe> Defines an inline
frame

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML JavaScript**

JavaScript makes HTML pages more dynamic and interactive.

### My First JavaScript

Click me to display Date and Time

рх	em	percent
5рх	0.3125em	31.25%
6рх	0.3750em	37.50%

25px	1.5625em	156.25%

### The HTML <script> Tag

The HTML <script> tag is used to define a client-side script (JavaScript).

The <script> element either contains script statements, or it points to an external script file through the src attribute.

Common uses for JavaScript are image manipulation, form validation, and dynamic changes of content.

To select an HTML element, JavaScript most often uses the document.getElementByld() method.

This JavaScript example writes "Hello JavaScript!" into an HTML element with id="demo":

#### **Example**

```
<script>
document.getElementById("demo").innerHTML = "Hello JavaScript!";
</script>
```

Tip: You can learn much more about JavaScript in our JavaScript Tutorial.

### A Taste of JavaScript

Here are some examples of what JavaScript can do:

#### **Example**

JavaScript can change content:

document.getElementById("demo").innerHTML = "Hello JavaScript!";

JavaScript can change styles:

```
document.getElementById("demo").style.fontSize = "25px";
document.getElementById("demo").style.color = "red";
document.getElementById("demo").style.backgroundColor = "yellow";
```

#### **Example**

JavaScript can change attributes:

document.getElementById("image").src = "picture.gif";

### The HTML <noscript> Tag

The HTML <noscript> tag defines an alternate content to be displayed to users that have disabled scripts in their browser or have a browser that doesn't support scripts:

#### **Example**

```
<script>
document.getElementById("demo").innerHTML = "Hello JavaScript!";
</script>
<noscript>Sorry, your browser does not support JavaScript!</noscript>
```

#### **HTML Exercises**

### **HTML Script Tags**

Tag Description

<script> Defines a client-side script

<noscript> Defines an alternate content for users that do not support client-side scripts

Content of the content for users that do not support client-side scripts

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML File Paths**

A file path describes the location of a file in a web site's folder structure.

### File Path Examples

| Path                             | Description   |
|----------------------------------|---|
| <img src="picture.jpg"/>         | The "picture.jpg" file is located in the same folder as the current page              |
| <img src="images/picture.jpg"/>  | The "picture.jpg" file is located in the images folder in the current folder          |
| <img src="/images/picture.jpg"/> | The "picture.jpg" file is located in the images folder at the root of the current web |
| <img src="/picture.jpg"/>        | The "picture.jpg" file is located in the folder one level up from the current folder  |

#### **HTML File Paths**

A file path describes the location of a file in a web site's folder structure.

File paths are used when linking to external files, like:

- · Web pages
- Images

- · Style sheets
- JavaScripts

#### **Absolute File Paths**

An absolute file path is the full URL to a file:

#### **Example**

<img src="https://www.w3schools.com/images/picture.jpg" alt="Mountain">

The <img> tag is explained in the chapter: HTML Images.

#### **Relative File Paths**

A relative file path points to a file relative to the current page.

In the following example, the file path points to a file in the images folder located at the root of the current web:

#### **Example**

<img src="/images/picture.jpg" alt="Mountain">

In the following example, the file path points to a file in the images folder located in the current folder:

#### **Example**

<img src="images/picture.jpg" alt="Mountain">

In the following example, the file path points to a file in the images folder located in the folder one level up from the current folder:

#### **Example**

<img src="../images/picture.jpg" alt="Mountain">

#### **Best Practice**

It is best practice to use relative file paths (if possible).

When using relative file paths, your web pages will not be bound to your current base URL. All links will work on your own computer (localhost) as well as on your current public domain and your future public domains.

### **HTML - The Head Element**

The HTML <head> element is a container for the following elements: <title>, <style>, <meta>, <link>, <script>, and <base>.

#### The HTML <head> Element

The <head> element is a container for metadata (data about data) and is placed between the <html> tag and the <body> tag.

HTML metadata is data about the HTML document. Metadata is not displayed.

Metadata typically define the document title, character set, styles, scripts, and other meta information.

#### The HTML <title> Element

The <title> element defines the title of the document. The title must be text-only, and it is shown in the browser's title bar or in the page's tab.

The <title> element is required in HTML documents!

The contents of a page title is very important for search engine optimization (SEO)! The page title is used by search engine algorithms to decide the order when listing pages in search results.

The <title> element:

- · defines a title in the browser toolbar
- provides a title for the page when it is added to favorites
- · displays a title for the page in search engine-results

So, try to make the title as accurate and meaningful as possible!

A simple HTML document:

#### **Example**

```
<!DOCTYPE html>
<html>
<head>
 <title>A Meaningful Page Title</title>
</head>
<body>
```

The content of the document.....

</body>

### The HTML <style> Element

The <style> element is used to define style information for a single HTML page:

#### **Example**

<style>
 body {background-color: powderblue;}
 h1 {color: red;}
 p {color: blue;}
</style>

#### The HTML < link > Element

The link> element defines the relationship between the current document and an external resource.

The link> tag is most often used to link to external style sheets:

#### **Example**

k rel="stylesheet" href="mystyle.css">

Tip: To learn all about CSS, visit our CSS Tutorial.

#### The HTML <meta> Element

The <meta> element is typically used to specify the character set, page description, keywords, author of the document, and viewport settings.

The metadata will not be displayed on the page, but are used by browsers (how to display content or reload page), by search engines (keywords), and other web services.

#### Define the character set used:

<meta charset="UTF-8">

#### Define keywords for search engines:

<meta name="keywords" content="HTML, CSS, JavaScript">

#### Define a description of your web page:

<meta name="description" content="Free Web tutorials">

#### Define the author of a page:

<meta name="author" content="John Doe">

#### Refresh document every 30 seconds:

<meta http-equiv="refresh" content="30">

#### Setting the viewport to make your website look good on all devices:

<meta name="viewport" content="width=device-width, initial-scale=1.0">

Example of <meta> tags:

#### **Example**

```
<meta charset="UTF-8">
<meta name="description" content="Free Web tutorials">
<meta name="keywords" content="HTML, CSS, JavaScript">
<meta name="author" content="John Doe">
```

### **Setting The Viewport**

The viewport is the user's visible area of a web page. It varies with the device - it will be smaller on a mobile phone than on a computer screen.

You should include the following < meta> element in all your web pages:

<meta name="viewport" content="width=device-width, initial-scale=1.0">

This gives the browser instructions on how to control the page's dimensions and scaling.

The width=device-width part sets the width of the page to follow the screen-width of the device (which will vary depending on the device).

The initial-scale=1.0 part sets the initial zoom level when the page is first loaded by the browser.

Here is an example of a web page without the viewport meta tag, and the same web page with the viewport meta tag:

Tip: If you are browsing this page with a phone or a tablet, you can click on the two links below to see the difference.

Without the viewport meta tag

With the viewport meta tag

### The HTML <script> Element

The <script> element is used to define client-side JavaScripts.

The following JavaScript writes "Hello JavaScript!" into an HTML element with id="demo":

#### **Example**

<script>

```
function myFunction() {
    Â document.getElementById("demo").innerHTML = "Hello JavaScript!";
}
</script>
```

Tip: To learn all about JavaScript, visit our <u>JavaScript Tutorial</u>.

#### The HTML <base> Element

The <base> element specifies the base URL and/or target for all relative URLs in a page.

The <base> tag must have either an href or a target attribute present, or both.

There can only be one single <base> element in a document!

#### **Example**

Specify a default URL and a default target for all links on a page:

```
<head>
<base href="https://www.w3schools.com/" target="_blank">
</head>
<body>
<img src="images/stickman.gif" width="24" height="39" alt="Stickman">
<a href="tags/tag_base.asp">HTML base Tag</a>
</body>
```

### **Chapter Summary**

- The <head> element is a container for metadata (data about data)
- The <head> element is placed between the <html> tag and the <body> tag
- The <title> element is required and it defines the title of the document
- The <style> element is used to define style information for a single document
- The tag is most often used to link to external style sheets
- The <meta> element is typically used to specify the character set, page description, keywords, author of the document, and viewport settings
- The <script> element is used to define client-side JavaScripts
- The <base> element specifies the base URL and/or target for all relative URLs in a page

#### **HTML** head Elements

Tag	Description
<head></head>	Defines information about the document
<title>&lt;/td&gt;&lt;td&gt;Defines the title of a document&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;base&gt;&lt;/td&gt;&lt;td&gt;Defines a default address or a default target for all links on a page&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;li&gt;&lt;li&gt;&lt;li&gt;&lt;/li&gt;&lt;/ul&gt;&lt;/td&gt;&lt;td&gt;Defines the relationship between a document and an external resource&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;meta&gt;&lt;/td&gt;&lt;td&gt;Defines metadata about an HTML document&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;script&gt;&lt;/td&gt;&lt;td&gt;Defines a client-side script&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;style&gt;&lt;/td&gt;&lt;td&gt;Defines style information for a document&lt;/td&gt;&lt;/tr&gt;&lt;/tbody&gt;&lt;/table&gt;</title>	

For a complete list of all available HTML tags, visit our <u>HTML Tag Reference</u>.

# **HTML Layout Elements and Techniques**

Websites often display content in multiple columns (like a magazine or a newspaper).

#### **Example**

#### **Cities**

- London
- Paris
- Tokyo

#### London

London is the capital city of England. It is the most populous city in the United Kingdom, with a metropolitan area of over 13 million inhabitants.

Standing on the River Thames, London has been a major settlement for two millennia, its history going back to its founding by the Romans, who named it Londinium.

Footer

### **HTML Layout Elements**

HTML has several semantic elements that define the different parts of a web page:

#### HTML5 Semantic Elements

<header> - Defines a header for a document or a section

<nav> - Defines a set of navigation links

<section> - Defines a section in a document

<article> - Defines an independent, self-contained content

<aside> - Defines content aside from the content (like a sidebar)

<footer> - Defines a footer for a document or a section

<details> - Defines additional details that the user can open and close on demand

<summary> - Defines a heading for the < details> element

#### HTML5 Semantic Elements

- <header> Defines a header for a document or a section
- <nav> Defines a set of navigation links
- <section> Defines a section in a document
- <article> Defines an independent, self-contained content
- <aside> Defines content aside from the content (like a sidebar)
- <footer> Defines a footer for a document or a section
- <details> Defines additional details that the user can open and close on demand
- <summary> Defines a heading for the<details> element

You can read more about semantic elements in our HTML Semantics chapter.

### **HTML Layout Techniques**

There are four different techniques to create multicolumn layouts. Each technique has its pros and cons:

- · CSS framework
- CSS float property
- CSS flexbox
- CSS grid

#### **CSS Frameworks**

If you want to create your layout fast, you can use a CSS framework, like W3.CSS or Bootstrap.

### **CSS Float Layout**

It is common to do entire web layouts using the CSSfloat property. Float is easy to learn - you just need to remember how the float and clear properties work. **Disadvantages:** Floating elements are tied to the document flow, which may harm the flexibility. Learn more about float in our <u>CSS Float and Clear</u> chapter.

#### Example

#### **Cities**

- London
- Paris
- Tokyo

#### London

London is the capital city of England. It is the most populous city in the United Kingdom, with a metropolitan area of over 13 million inhabitants.

Standing on the River Thames, London has been a major settlement for two millennia, its history going back to its founding by the Romans, who named it Londinium.

Footer

### **CSS Flexbox Layout**

Use of flexbox ensures that elements behave predictably when the page layout must accommodate different screen sizes and different display devices.

Learn more about flexbox in our CSS Flexbox chapter.

#### Example

#### **Cities**

- London
- Paris
- Tokyo

#### London

London is the capital city of England. It is the most populous city in the United Kingdom, with a metropolitan area of over 13 million inhabitants.

Standing on the River Thames, London has been a major settlement for two millennia, its history going back to its founding by the Romans, who named it Londinium.

Footer

### **CSS Grid Layout**

The CSS Grid Layout Module offers a grid-based layout system, with rows and columns, making it easier to design web pages without having to use floats and positioning.

Learn more about CSS grids in our CSS Grid View chapter.

# **HTML** Responsive Web Design

Responsive web design is about creating web pages that look good on all devices!

A responsive web design will automatically adjust for different screen sizes and viewports.

### What is Responsive Web Design?

Responsive Web Design is about using HTML and CSS to automatically resize, hide, shrink, or enlarge, a website, to make it look good on all devices (desktops, tablets, and phones):

Try it Yourself »

### **Setting The Viewport**

To create a responsive website, add the following<meta> tag to all your web pages:

#### Example

<meta name="viewport" content="width=device-width, initial-scale=1.0">

This will set the viewport of your page, which will give the browser instructions on how to control the page's dimensions and scaling.

Here is an example of a web page without the viewport meta tag, and the same web page with the viewport meta tag:

Without the viewport meta tag: With the viewport meta tag:

Tip: If you are browsing this page on a phone or a tablet, you can click on the two links above to see the difference.

### Responsive Images

Responsive images are images that scale nicely to fit any browser size.

#### **Using the width Property**

If the CSS width property is set to 100%, the image will be responsive and scale up and down:

#### **Example**

<img src="img\_girl.jpg" style="width:100%;">

Notice that in the example above, the image can be scaled up to be larger than its original size. A better solution, in many cases, will be to use the max-width property instead.

#### Using the max-width Property

If the max-width property is set to 100%, the image will scale down if it has to, but never scale up to be larger than its original size:

#### **Example**

<img src="img\_girl.jpg" style="max-width:100%;height:auto;">

#### **Show Different Images Depending on Browser Width**

The HTML <picture> element allows you to define different images for different browser window sizes.

Resize the browser window to see how the image below change depending on the width:

#### **Example**

<picture>

A <source srcset="img\_smallflower.jpg" media="(max-width: 600px)">

```
A <source srcset="img_flowers.jpg" media="(max-width: 1500px)"> \hat{A} <source srcset="flowers.jpg"> \hat{A} <img src="img_smallflower.jpg" alt="Flowers"> </picture>
```

### **Responsive Text Size**

The text size can be set with a "vw" unit, which means the "viewport width".

That way the text size will follow the size of the browser window:

### **Hello World**

Resize the browser window to see how the text size scales.

#### Example

```
<h1 style="font-size:10vw">Hello World</h1>
```

Viewport is the browser window size. 1vw = 1% of viewport width. If the viewport is 50cm wide, 1vw is 0.5cm.

#### **Media Queries**

In addition to resize text and images, it is also common to use media queries in responsive web pages.

With media queries you can define completely different styles for different browser sizes.

Example: resize the browser window to see that the three div elements below will display horizontally on large screens and stacked vertically on small screens:

Left Menu

Main Content

Right Content

#### Example

Tip: To learn more about Media Queries and Responsive Web Design, read our RWD Tutorial.

### **Responsive Web Page - Full Example**

A responsive web page should look good on large desktop screens and on small mobile phones.

# **Responsive Web Design - Frameworks**

All popular CSS Frameworks offer responsive design.

They are free, and easy to use.

#### W3.CSS

W3.CSS is a modern CSS framework with support for desktop, tablet, and mobile design by default.

W3.CSS is smaller and faster than similar CSS frameworks.

W3.CSS is designed to be a high quality alternative to Bootstrap.

W3.CSS is designed to be independent of jQuery or any other JavaScript library.

# **W3.CSS Demo**

Resize the page to see the responsiveness!

#### London

London is the capital city of England.

It is the most populous city in the United Kingdom, with a metropolitan area of over 13 million inhabitants.

#### **Paris**

Paris is the capital of France.

The Paris area is one of the largest population centers in Europe, with more than 12 million inhabitants.

### **Tokyo**

Tokyo is the capital of Japan.

It is the center of the Greater Tokyo Area, and the most populous metropolitan area in the world.

#### **Example**

```
<!DOCTYPE html>
<html>
<meta name="viewport" content="width=device-width, initial-scale=1">
<link rel="stylesheet" href="https://www.w3schools.com/w3css/4/w3.css">
<div class="w3-container w3-green">
 <h1>W3Schools Demo</h1>
 Resize this responsive page!
</div>
<div class="w3-row-padding">
 <div class="w3-third">
ÂÂÂ <h2>London</h2>
 Â Â London is the capital city of England.
 Â Â It is the most populous city in the United Kingdom,
 Â Â with a metropolitan area of over 13 million inhabitants.
 </div>
 <div class="w3-third">
ÂÂÂ <h2>Paris</h2>
 Â Â Paris is the capital of France.
 Â Â The Paris area is one of the largest population centers in Europe,
 Â Â with more than 12 million inhabitants.
 </div>
 <div class="w3-third">
\hat{A} \hat{A} \hat{A} < h2 > Tokyo < /h2 >
\hat{A} \hat{A} \hat{A}  Tokyo is the capital of Japan.
 Â Â It is the center of the Greater Tokyo Area,
\hat{A} \hat{A} \hat{A} and the most populous metropolitan area in the world.
 </div>
</div>
</body>
</html>
```

To learn more about W3.CSS, read our W3.CSS Tutorial.

### **Bootstrap**

Another popular CSS framework is Bootstrap. Bootstrap uses HTML, CSS and jQuery to make responsive web pages.

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Bootstrap Example</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">
link rel="stylesheet" href="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/css/bootstrap.min.css">
<script src="https://ajax.googleapis.com/ajax/libs/jquery/3.5.1/jquery.min.js"></script>
<script src="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/js/bootstrap.min.js"></script>
</head>
<body>
```

```
<div class="container">
 <div class="jumbotron">
 Â Â <h1>My First Bootstrap Page</h1>
A </div>
A <div class="row">
 Â Â <div class="col-sm-4">
ÂÂÂÂÂ ...
ÂÂÂ </div>
 Â Â <div class="col-sm-4">
ÂÂÂÂÂ ...
\hat{A} \hat{A} \hat{A} < /div>
 Â Â <div class="col-sm-4">
ÂÂÂ ...
\hat{A} \hat{A} \hat{A} < /div>
 </div>
</div>
</body>
</html>
```

To learn more about Bootstrap, go to our Bootstrap Tutorial.

# **HTML Computer Code Elements**

HTML contains several elements for defining user input and computer code.

#### **Example**

<code>
x = 5;
y = 6;
z = x + y;
</code>

# HTML <kbd> For Keyboard Input

The HTML <kbd> element is used to define keyboard input. The content inside is displayed in the browser's default monospace font.

#### Example

Define some text as keyboard input in a document:

Save the document by pressing <kbd>Ctrl + S</kbd>

Result:

Save the document by pressing Ctrl + S

### HTML <samp> For Program Output

The HTML <samp> element is used to define sample output from a computer program. The content inside is displayed in the browser's default monospace font.

#### Example

Define some text as sample output from a computer program in a document:

```
Message from my computer:<samp>File not found.<br/>Press F1 to continue</samp>
```

Result:

Message from my computer:

File not found.
Press F1 to continue

### **HTML < code > For Computer Code**

The HTML <code> element is used to define a piece of computer code. The content inside is displayed in the browser's default monospace font.

#### **Example**

Define some text as computer code in a document:

```
<code>
x = 5;
y = 6;
z = x + y;
</code>
Result:
x = 5; y = 6; z = x + y;
```

Notice that the <code> element does not preserve extra whitespace and line-breaks.

To fix this, you can put the <code> element inside a element:

#### **Example**

```
<code>
x = 5;
y = 6;
z = x + y;
</code>

Result:
x = 5;
y = 6;
```

Z = X + Y;

#### HTML <var> For Variables

The HTML <var> element is used to define a variable in programming or in a mathematical expression. The content inside is typically displayed in italic.

#### **Example**

Define some text as variables in a document:

The area of a triangle is:  $1/2 \times var>b</var> \times var>h</var>$ , where var>b</var> is the base, and var>b</var> is the vertical height.

Result:

The area of a triangle is:  $1/2 \times b \times h$ , where b is the base, and h is the vertical height.

### **Chapter Summary**

- The <kbd> element defines keyboard input
- The <samp> element defines sample output from a computer program
- The <code> element defines a piece of computer code
- The <var> element defines a variable in programming or in a mathematical expression
- The element defines preformatted text

#### **HTML Exercises**

### **HTML Computer Code Elements**

Tag	Description
<code></code>	Defines programming code
<kbd></kbd>	Defines keyboard inputÂ
<samp></samp>	Defines computer output
<var></var>	Defines a variable
<pre>&lt;</pre>	Defines preformatted text

For a complete list of all available HTML tags, visit our HTML Tag Reference.

### **HTML Semantic Elements**

Semantic elements = elements with a meaning.

#### What are Semantic Elements?

A semantic element clearly describes its meaning to both the browser and the developer.

Examples of non-semantic elements: <div> and <span> - Tells nothing about its content.

Examples of **semantic** elements: <form>, , and <article> - Clearly defines its content.

#### Semantic Elements in HTML

Many web sites contain HTML code like: <div id="nav"> <div class="header"> <div id="footer"> to indicate navigation, header, and footer.

In HTML there are some semantic elements that can be used to define different parts of a web page: Â

- <article>
- <aside>
- <details>
- <figcaption>
- <figure>
- <footer>
- <header>
- <main><mark>
- <nav>
- <section>
- <summary>
- <time>

	_								
Н	Т	ML	. Se	ma	ntic	Ele	mer	าtร	
٠.	•								

#### HTML <section> Element

The <section> element defines a section in a document.

According to W3C's HTML documentation: "A section is a thematic grouping of content, typically with a heading."

A web page could normally be split into sections for introduction, content, and contact information.

Two sections in a document:

```
<section>
<h1>WWF</h1>
```

The World Wide Fund for Nature (WWF) is an international organization working on issues regarding the conservation, research and restoration of the environment, formerly named the World Wildlife Fund. WWF was founded in 1961. </section>

```
<section>
```

<h1>WWF's Panda symbol</h1>

The Panda has become the symbol of WWF. The well-known panda logo of WWF originated from a panda named Chi Chi that was transferred from the Beijing Zoo to the London Zoo in the same year of the establishment of WWF. </section>

#### HTML <article> Element

The <article> element specifies independent, self-contained content.

An article should make sense on its own, and it should be possible to distribute it independently from the rest of the web site.

Examples of where an <article> element can be used:

- Forum post
- · Blog post
- Newspaper article

#### **Example**

Three articles with independent, self-contained content:

```
<article>
<h2>Google Chrome</h2>
<Google Chrome is a web browser developed by Google, released in 2008. Chrome is the world's most popular web</p>
browser today!
</article>
<article>
<h2>Mozilla Firefox</h2>
Mozilla Firefox is an open-source web browser developed by Mozilla. Firefox has been the second most popular web
browser since January, 2018.
</article>
<article>
<h2>Microsoft Edge</h2>
Microsoft Edge is a web browser developed by Microsoft, released in 2015. Microsoft Edge replaced Internet Explorer.
</article>
```

#### **Example 2**

Use CSS to style the <article> element:

```
<html>
<head>
<style>
.all-browsers {
 margin: 0;
A padding: 5px;
A background-color: lightgray;
.all-browsers > h1, .browser {
A margin: 10px;
A padding: 5px;
}
.browser {
```

A background: white;

```
}
.browser > h2, p {
 margin: 4px;
A font-size: 90%;
</style>
</head>
<body>
<article class="all-browsers">
 <h1>Most Popular Browsers</h1>
 <article class="browser">
 Â Â <h2>Google Chrome</h2>
\hat{A} \hat{A} \hat{A} Google Chrome is a web browser developed by Google, released in 2008. Chrome is the world's most popular
web browser today!
 </article>
 <article class="browser">
 Â Â <h2>Mozilla Firefox</h2>
\hat{A} \hat{A} \hat{A} Mozilla Firefox is an open-source web browser developed by Mozilla. Firefox has been the second most popular
web browser since January, 2018.
 </article>
A <article class="browser">
 Â Â <h2>Microsoft Edge</h2>
 Â Â Microsoft Edge is a web browser developed by Microsoft, released in 2015. Microsoft Edge replaced Internet
Explorer.
 </article>
</article>
</body>
</html>
```

### Nesting <article> in <section> or Vice Versa?

The <article> element specifies independent, self-contained content.

The <section> element defines section in a document.

Can we use the definitions to decide how to nest those elements? No, we cannot!

So, you will find HTML pages with <section> elements containing <article> elements, and <article> elements containing <section> elements.

#### HTML <header> Element

The <header> element represents a container for introductory content or a set of navigational links.

A <header> element typically contains:

- one or more heading elements (<h1> <h6>)
- · logo or icon
- · authorship information

**Note:** You can have several <neader> elements in one HTML document. However, <neader> cannot be placed within a <footer>, <address> or another <neader> element.

```
A header for an <article>:Â
```

```
<article>
 <header>
 Â Â <h1>What Does WWF Do?</h1>
 Â Â WWF's mission:
 </header>
 WWF's mission is to stop the degradation of our planet's natural environment, Â and build a future in which humans live in harmony with nature.
</article>
```

#### HTML <footer> Element

The <footer> element defines a footer for a document or section.

A <footer> element typically contains:

- · authorship information
- · copyright information
- · contact information
- sitemap
- · back to top links
- · related documents

You can have several <footer> elements in one document.

#### **Example**

A footer section in a document:

<footer>

Author: Hege Refsnes

Ä <a href="mailto:hege@example.com">hege@example.com</a>

</footer>

#### HTML <nav> Element

The <nav> element defines a set of navigation links.

Notice that NOT all links of a document should be inside a<nav> element. The <nav> element is intended only for major block of navigation links.

Browsers, such as screen readers for disabled users, can use this element to determine whether to omit the initial rendering of this content.

#### **Example**

A set of navigation links:

<nav>

 $\hat{A}$  <a href="/html/">HTML</a> |

 $\hat{A}$  <a href="/css/">CSS</a> |

<a href="/js/">JavaScript</a> |

<a href="/jquery/">jQuery</a>

</nav>

#### HTML <aside> Element

The <aside> element defines some content aside from the content it is placed in (like a sidebar).

The <aside> content should be indirectly related to the surrounding content.

#### **Example**

Display some content aside from the content it is placed in:

My family and I visited The Epcot center this summer. The weather was nice, and Epcot was amazing! I had a great summer together with my family!

<aside>

<h4>Epcot Center</h4>

Epcot is a theme park at Walt Disney World Resort featuring exciting attractions, international pavilions, award-winning fireworks and seasonal special events.

</aside>

Use CSS to style the <aside> element:

```
<html>
<head>
<style>
aside {
 width: 30%;
 padding-left: 15px;
 margin-left: 15px;
 float: right;
 font-style: italic;
 background-color: lightgray;
}
</style>
</head>
<body>
```

My family and I visited The Epcot center this summer. The weather was nice, and Epcot was amazing! I had a great summer together with my family!

<aside>

The Epcot center is a theme park at Walt Disney World Resort featuring exciting attractions, international pavilions, award-winning fireworks and seasonal special events.

</aside>

My family and I visited The Epcot center this summer. The weather was nice, and Epcot was amazing! I had a great summer together with my family!

My family and I visited The Epcot center this summer. The weather was nice, and Epcot was amazing! I had a great summer together with my family!

</body>

### HTML <figure> and <figcaption> Elements

The <figure> tag specifies self-contained content, like illustrations, diagrams, photos, code listings, etc.

The <figcaption> tag defines a caption for a <figure> element. The <figcaption> element can be placed as the first or as the last child of a <figure> element.

The <img> element defines the actual image/illustration.Â

#### **Example**

```
<figure>
 <img src="pic_trulli.jpg" alt="Trulli">
 <figcaption>Fig1. - Trulli, Puglia, Italy.</figcaption>
</figure>
```

### Why Semantic Elements?

According to the W3C: "A semantic Web allows data to be shared and reused across applications, enterprises, and communities."

#### Semantic Elements in HTML

Below is a list of some of the semantic elements in HTML.

Tag	Description
<article></article>	Defines independent, self-contained content
<aside></aside>	Defines content aside from the page content
<details></details>	Defines additional details that the user can view or hide
<pre><figcaption></figcaption></pre>	Defines a caption for a <figure> element</figure>
<figure></figure>	Specifies self-contained content, like illustrations, diagrams, photos, code listings, etc.

<mark> Defines marked/highlighted text

<nav> Defines navigation links

<u><section></u>
Defines a section in a document

<u><summary></u> Defines a visible heading for a <details> element

<time>
Defines a date/time

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Style Guide and Coding Conventions**

A consistent, clean, and tidy HTML code makes it easier for others to read and understand your code.

Here are some guidelines and tips for creating good HTML code.

### **Always Declare Document Type**

Always declare the document type as the first line in your document.

The correct document type for HTML is:

<!DOCTYPE html>

#### **Use Lowercase Element Names**

HTML allows mixing uppercase and lowercase letters in element names.

However, we recommend using lowercase element names, because:

- Mixing uppercase and lowercase names looks bad
- · Developers normally use lowercase names
- · Lowercase looks cleaner
- · Lowercase is easier to write

#### Good:

```
<br/><body><br/>This is a paragraph.</body>
```

#### Bad:

```
<BODY>
<P>This is a paragraph.</P>
</BODY>
```

#### **Close All HTML Elements**

In HTML, you do not have to close all elements (for example the element).

However, we strongly recommend closing all HTML elements, like this:

#### Good:

<section> This is a paragraph. This is a paragraph. </section>

#### Bad:

<section>

This is a paragraph.

 $\hat{A}$  This is a paragraph.

</section>

#### **Use Lowercase Attribute Names**

HTML allows mixing uppercase and lowercase letters in attribute names.

However, we recommend using lowercase attribute names, because:

- · Mixing uppercase and lowercase names looks bad
- · Developers normally use lowercase names
- · Lowercase look cleaner
- · Lowercase are easier to write

#### Good:

<a href="https://www.w3schools.com/html/">Visit our HTML tutorial</a>

#### Bad:

<a HREF="https://www.w3schools.com/html/">Visit our HTML tutorial</a>

### Always Quote Attribute Values

HTML allows attribute values without quotes.

However, we recommend quoting attribute values, because:

- · Developers normally quote attribute values
- · Quoted values are easier to read
- You MUST use quotes if the value contains spaces

#### Good:

#### Bad:

#### Very bad:

This will not work, because the value contains spaces:

### Always Specify alt, width, and height for Images

Always specify the alt attribute for images. This attribute is important if the image for some reason cannot be displayed.

Also, always define the width and height of images. This reduces flickering, because the browser can reserve space for the image before loading.

#### Good:

<img src="html5.gif" alt="HTML5" style="width:128px;height:128px">

#### Bad:

<img src="html5.gif">

### **Spaces and Equal Signs**

HTML allows spaces around equal signs. But space-less is easier to read and groups entities better together.

#### Good:

<link rel="stylesheet" href="styles.css">

#### Bad:

k rel = "stylesheet" href = "styles.css">

### **Avoid Long Code Lines**

When using an HTML editor, it is NOT convenient to scroll right and left to read the HTML code.

Try to avoid too long code lines.

#### **Blank Lines and Indentation**

Do not add blank lines, spaces, or indentations without a reason.

For readability, add blank lines to separate large or logical code blocks.

For readability, add two spaces of indentation. Do not use the tab key.

#### Good:

<body>

<h1>Famous Cities</h1>

<h2>Tokyo</h2>

Tokyo is the capital of Japan, the center of the Greater Tokyo Area, and the most populous metropolitan area in the world.
It is the seat of the Japanese government and the Imperial Palace,

and the home of the Japanese Imperial Family.

and the nome of the dapanese imperial raining.

</body>

#### Bad:

<body>

<h1>Famous Cities</h1>

 $\hat{A}$  <h2>Tokyo</h2>

A

 $\hat{A}$   $\hat{A}$   $\hat{A}$  Tokyo is the capital of Japan, the center of the Greater Tokyo Area,

Â Â and the most populous metropolitan area in the world.

 $\hat{A} \hat{A} \hat{A}$  It is the seat of the Japanese government and the Imperial Palace,

Â Â and the home of the Japanese Imperial Family.

</body>

#### **Good Table Example:**

ÂÂÂ Name

ÂÂÂ Description

#### Good List Example:

Â London
 Â Paris
 Â Tokyo

### Never Skip the <title> Element

The <title> element is required in HTML.

The contents of a page title is very important for search engine optimization (SEO)! The page title is used by search engine algorithms to decide the order when listing pages in search results.

The <title> element:

- · defines a title in the browser toolbar
- provides a title for the page when it is added to favorites
- · displays a title for the page in search-engine results

So, try to make the title as accurate and meaningful as possible:Â

<title>HTML Style Guide and Coding Conventions</title>

### Omitting <a href="https://www.enaltriangraph.com/">httml> and <body>?</a>

An HTML page will validate without the <a href="html"><a href="html">html</a> and <b dots="html">dots="html">body> tags:</a>

#### **Example**

<!DOCTYPE html>
<head>
 <title>Page Title</title>
</head>

<h1>This is a heading</h1>
This is a paragraph.

However, we strongly recommend to always add the <a href="html">html</a> and <body> tags!

Omitting <body> can produce errors in older browsers.

Omitting <a href="html">html</a> and <body> can also crash DOM and XML software.

### Omitting <head>?

The HTML <head> tag can also be omitted.

Browsers will add all elements before <body>, to a default <head> element.

#### **Example**

<!DOCTYPE html> <html> <title>Page Title</title> <body>

```
<h1>This is a heading</h1>
This is a paragraph.
</body>
</html>
```

However, we recommend using the <head> tag.

### **Close Empty HTML Elements?**

In HTML, it is optional to close empty elements.

#### Allowed:

<meta charset="utf-8">

#### Also Allowed:

<meta charset="utf-8" />

If you expect XML/XHTML software to access your page, keep the closing slash (/), because it is required in XML and XHTML.

### Add the lang Attribute

You should always include the lang attribute inside the <a href="html">html</a>> tag, to declare the language of the Web page. This is meant to assist search engines and browsers.

#### **Example**

```
<!DOCTYPE html>
<html lang="en-us">
<head>
 <title>Page Title</title>
</head>
<body>
<h1>This is a heading</h1>
This is a paragraph.
</body>
</html>
```

#### **Meta Data**

To ensure proper interpretation and correct search engine indexing, both the language and the character encoding <meta charset="charset"> should be defined as early as possible in an HTML document:

```
<!DOCTYPE html>
<html lang="en-us">
<head>
 <meta charset="UTF-8">
 <title>Page Title</title>
</head>
```

### **Setting The Viewport**

The viewport is the user's visible area of a web page. It varies with the device - it will be smaller on a mobile phone than on a computer screen.

You should include the following <meta> element in all your web pages:

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

This gives the browser instructions on how to control the page's dimensions and scaling.

The width=device-width part sets the width of the page to follow the screen-width of the device (which will vary depending on the device).

The initial-scale=1.0 part sets the initial zoom level when the page is first loaded by the browser.

Here is an example of a web page without the viewport meta tag, and the same web page with the viewport meta tag:

Tip: If you are browsing this page with a phone or a tablet, you can click on the two links below to see the difference.

Without the viewport meta tag

With the viewport meta tag

#### **HTML Comments**

Short comments should be written on one line, like this:

```
<!-- This is a comment -->
```

Comments that spans more than one line, should be written like this:

<!--

A This is a long comment example. This is a long comment example.

A This is a long comment example. This is a long comment example.

-->

Long comments are easier to observe if they are indented with two spaces.

### **Using Style Sheets**

Use simple syntax for linking to style sheets (thetype attribute is not necessary):

```
<link rel="stylesheet" href="styles.css">
```

Short CSS rules can be written compressed, like this:

p.intro {font-family:Verdana;font-size:16em;}

Long CSS rules should be written over multiple lines:

```
body {
 background-color: lightgrey;
 font-family: "Arial Black", Helvetica, sans-serif;
 font-size: 16em;
 color: black;
}
```

- Place the opening bracket on the same line as the selector
- · Use one space before the opening bracket
- Use two spaces of indentation
- · Use semicolon after each property-value pair, including the last
- Only use quotes around values if the value contains spaces
- · Place the closing bracket on a new line, without leading spaces

### Loading JavaScript in HTML

Use simple syntax for loading external scripts (the type attribute is not necessary):

<script src="myscript.js">

## **Accessing HTML Elements with JavaScript**

Using "untidy" HTML code can result in JavaScript errors.

These two JavaScript statements will produce different results:

#### **Example**

getElementById("Demo").innerHTML = "Hello";

getElementById("demo").innerHTML = "Hello";

Visit the JavaScript Style Guide.

#### **Use Lower Case File Names**

Some web servers (Apache, Unix) are case sensitive about file names: "london.jpg" cannot be accessed as "London.jpg".

Other web servers (Microsoft, IIS) are not case sensitive: "london.jpg" can be accessed as "London.jpg".

If you use a mix of uppercase and lowercase, you have to be aware of this.

If you move from a case-insensitive to a case-sensitive server, even small errors will break your web!

To avoid these problems, always use lowercase file names!

#### **File Extensions**

HTML files should have a .html extension (.htm is allowed).

CSS files should have a.css extension.

JavaScript files should have a .js extension.

#### Differences Between .htm and .html?

There is no difference between the .htm and .html file extensions!

Both will be treated as HTML by any web browser and web server.

#### **Default Filenames**

When a URL does not specify a filename at the end (like "https://www.w3schools.com/"), the server just adds a default filename, such as "index.html", "index.html", "default.html".

If your server is configured only with "index.html" as the default filename, your file must be named "index.html", and not "default.html".

However, servers can be configured with more than one default filename; usually you can set up as many default filenames as you want.

### **HTML Entities**

Reserved characters in HTML must be replaced with character entities.

#### **HTML Entities**

Some characters are reserved in HTML.

If you use the less than (<) or greater than (>) signs in your text, the browser might mix them with tags.

Character entities are used to display reserved characters in HTML.

A character entity looks like this:

&entity\_name;

OR

&#entity\_number,

To display a less than sign (<) we must write:&It; or &#60;

Advantage of using an entity name: An entity name is easy to remember.

**Disadvantage of using an entity name:** Browsers may not support all entity names, but the support for entity numbers is good.

### **Non-breaking Space**

A commonly used entity in HTML is the non-breaking space:

A non-breaking space is a space that will not break into a new line.

Two words separated by a non-breaking space will stick together (not break into a new line). This is handy when breaking the words might be disruptive.

#### Examples:

- § 10
- 10 km/h
- 10 PM

Another common use of the non-breaking space is to prevent browsers from truncating spaces in HTML pages.

If you write 10 spaces in your text, the browser will remove 9 of them. To add real spaces to your text, you can use the **&nbsp**; character entity.

**Tip:** The non-breaking hyphen (<u>&#8209;</u>) is used to define a hyphen character (â€') that does not break into a new line.

#### Some Useful HTML Character Entities

| Result | Description                        | Entity Name | Entity<br>Number   |
|--------|------------------------------------|-------------|--------------------|
|        | non-breaking space                 |             | <b>&amp;</b> #160; |
| <      | less than                          | <           | <b>&lt;</b> ;      |
| >      | greater than                       | >           | <b>&gt;</b> ;      |
| &      | ampersand                          | &           | <b>&amp;</b> ;     |
| "      | double quotation mark              | "           | <b>"</b> ;         |
| •      | single quotation mark (apostrophe) | '           | <b>'</b> ;         |
| ¢      | cent                               | ¢           | <b>&amp;</b> #162; |
| £      | pound                              | £           | £                  |
| Â¥     | yen                                | ¥           | <b>&amp;</b> #165; |
| â,¬    | euro                               | €           | €                  |
| ©      | copyright                          | ©           | <b>&amp;</b> #169; |
| ®      | registered trademark               | ®           | <b>&amp;</b> #174; |

Note: Entity names are case sensitive.

### **Combining Diacritical Marks**

A diacritical mark is a "glyph" added to a letter.

Some diacritical marks, like grave ( ̀) and acute (Â Ì) are called accents.

Diacritical marks can appear both above and below a letter, inside a letter, and between two letters.

Diacritical marks can be used in combination with alphanumeric characters to produce a character that is not present in the character set (encoding) used in the page.

Here are some examples:

#### **Mark Character Construct Result**

| ̀   | a | à | à           |
|-----|---|---|-------------|
| ÂÌ  | а | á | aÌ          |
| Ì,  | а | â | aÌ,         |
| ̃   | а | ã | aÌ <i>f</i> |
| ÂÌ€ | 0 | Ò | OÌ€         |
| ÂÌ  | 0 | Ó | OÌ          |
| Ì,  | 0 | Ô | OÌ,         |
| ̃   | 0 | Õ | OÌ <i>f</i> |

You will see more HTML symbols in the next chapter of this tutorial.

# **HTML Symbols**

Symbols that are not present on your keyboard can also be added by using entities.

### **HTML Symbol Entities**

HTML entities were described in the previous chapter.

Many mathematical, technical, and currency symbols, are not present on a normal keyboard.

To add such symbols to an HTML page, you can use the entity name or the entity number (a decimal or a hexadecimal reference) for the symbol.

#### **Example**

Display the euro sign, â,¬, with an entity name, a decimal, and a hexadecimal value:

```
| will display €
| will display €
| will display €
```

#### Will display as:

I will display â,¬ I will display â,¬ I will display â,¬

### Some Mathematical Symbols Supported by HTML

| Char | Number Entity | Description          |
|------|---------------|----------------------|
| â^€  | ∀ ∀           | FOR ALL              |
| â^,  | ∂ ∂           | PARTIAL DIFFERENTIAL |
| â^ƒ  | ∃ ∃           | THERE EXISTS         |
| â^   | ∅ ∅           | EMPTY SETS           |
| â^‡  | ∇ ∇           | NABLA                |
| â^^  | ∈ ∈           | ELEMENT OF           |
| â^‰  | ∉ ∉           | NOT AN ELEMENT OF    |
| â^‹  | ∋ ∋           | CONTAINS AS MEMBER   |
| â^   | ∏ ∏           | N-ARY PRODUCT        |

### Some Greek Letters Supported by HTML

| Char | Number | r Entity | Description                  |
|------|--------|----------|------------------------------|
| Α    | Α      | Α        | GREEK CAPITAL LETTER ALPHA   |
| Î'   | Β      | Β        | GREEK CAPITAL LETTER BETA    |
| Γ    | Γ      | Γ        | GREEK CAPITAL LETTER GAMMA   |
| Δ    | Δ      | Δ        | GREEK CAPITAL LETTER DELTA   |
| Ε    | Ε      | Ε        | GREEK CAPITAL LETTER EPSILON |
| Ζ    | Ζ      | Ζ        | GREEK CAPITAL LETTER ZETA    |

Full Greek Reference

### Some Other Entities Supported by HTML

| Char | Number Entity | Description        |
|------|---------------|--------------------|
| ©    | © ©           | COPYRIGHT SIGN     |
| ®    | ® ®           | REGISTERED SIGN    |
| â,¬  | € €           | EURO SIGN          |
| â"¢  | ™ ™           | TRADEMARK          |
| â†   | ← ←           | LEFTWARDS ARROW    |
| ↑    | ↑ ↑           | UPWARDS ARROW      |
| →    | → →           | RIGHTWARDS ARROW   |
| ↓    | ↓ ↓           | DOWNWARDS ARROW    |
| â™   | ♠ ♠           | BLACK SPADE SUIT   |
| ♣    | ♣ ♣           | BLACK CLUB SUIT    |
| ♥    | ♥ ♥           | BLACK HEART SUIT   |
| ♦    | ♦ ♦           | BLACK DIAMOND SUIT |
|      |               |                    |

# **Using Emojis in HTML**

Emojis are characters from the UTF-8 character set: ðŸ~, ðŸ~ ðŸ'—

# What are Emojis?

Emojis look like images, or icons, but they are not.

They are letters (characters) from the UTF-8 (Unicode) character set.

UTF-8 covers almost all of the characters and symbols in the world.

#### The HTML charset Attribute

To display an HTML page correctly, a web browser must know the character set used in the page.

```
This is specified in the <meta> tag:
<meta charset="UTF-8">
```

If not specified, UTF-8 is the default character set in HTML.

### **UTF-8 Characters**

Many UTF-8 characters cannot be typed on a keyboard, but they can always be displayed using numbers (called entity numbers):

- A is 65
- B is 66
- C is 67

### **Example**

```
<!DOCTYPE html>
<html>
<head>
<meta charset="UTF-8">
</head>
<body>
I will display A B C
I will display &#65; &#66; &#67;
</body>
</html>
```

### **Example Explained**

The <meta charset="UTF-8"> element defines the character set.

The characters A, B, and C, are displayed by the numbers 65, 66, and 67.

To let the browser understand that you are displaying a character, you must start the entity number with &# and end it with; (semicolon).

# **Emoji Characters**

Emojis are also characters from the UTF-8 alphabet:

- ðŸ~" is 128516
- ðŸ~ is 128525
  ðŸ'— is 128151

### **Example**

```
<!DOCTYPE html>
<html>
<head>
<meta charset="UTF-8">
</head>
<body>
<h1>My First Emoji</h1>
&#128512;
</body>
</html>
```

Since Emojis are characters, they can be copied, displayed, and sized just like any other character in HTML.

### **Example**

# Some Emoji Symbols in UTF-8

```
Emoji Value \delta\ddot{\gamma}—» 🗻 \delta\ddot{\gamma}—1/4 🗼 \delta\ddot{\gamma}—1/2 🗽 \delta\ddot{\gamma}—3/4 🗾 \delta\ddot{\gamma}—2 🗿 \delta\ddot{\gamma} 😀 \delta\ddot{\gamma} 😁 \delta\ddot{\gamma} 😂 \delta\ddot{\gamma} 😃 \delta\ddot{\gamma} 😄 \delta\ddot{\gamma} 😄 \delta\ddot{\gamma} 😅
```

For a full list, please go to our HTML Emoji Reference.

# **HTML Encoding (Character Sets)**

To display an HTML page correctly, a web browser must know which character set to use.

# From ASCII to UTF-8

ASCII was the first character encoding standard. ASCII defined 128 different characters that could be used on the internet: numbers (0-9), English letters (A-Z), and some special characters like ! + - () @ < >.

ISO-8859-1 was the default character set for HTML 4. This character set supported 256 different character codes. HTML 4 also supported UTF-8.

ANSI (Windows-1252) was the original Windows character set. ANSI is identical to ISO-8859-1, except that ANSI has 32 extra characters.

The HTML5 specification encourages web developers to use the UTF-8 character set, which covers almost all of the characters and symbols in the world!

### The HTML charset Attribute

To display an HTML page correctly, a web browser must know the character set used in the page.

This is specified in the < meta> tag:

```
<meta charset="UTF-8">
```

# **Differences Between Character Sets**

The following table displays the differences between the character sets described above:

Description

| Numb     | ASCII | ANSI   | 8859 | UTF-<br>8 |                        |
|----------|-------|--------|------|-----------|------------------------|
| 32       |       |        |      |           | space                  |
| 33       | !     | !      | !    | !         | exclamation mark       |
| 34       | "     | "      | "    | "         | quotation mark         |
| 35       | #     | #      | #    | #         | number sign            |
| 36       | \$    | \$     | \$   | \$        | dollar sign            |
| 37       | %     | %      | %    | %         | percent sign           |
| 38       | &     | &      | &    | &         | ampersand              |
| 39       | •     | ,      | ,    | •         | apostrophe             |
| 40       | (     | (      | (    | (         | left parenthesis       |
| 41       | )     | )      | )    | )         | right parenthesis      |
| 42       | *     | *      | *    | *         | asterisk               |
| 43       | +     | +      | +    | +         | plus sign              |
| 44       |       |        |      |           | comma                  |
| 45       | ,     | ,      | ,    | ,         | hyphen-minus           |
| 46       |       |        |      |           | full stop              |
| 47       | /     | /      |      | . /       | solidus                |
| 48       | 0     | 0      | 0    | 0         | digit zero             |
| 49       | 1     | 1      | 1    | 1         | digit one              |
| 50       | 2     | 2      | 2    | 2         | digit two              |
| 51       | 3     | 3      | 3    | 3         | digit three            |
| 52       | 4     | 4      | 4    | 4         | digit four             |
| 53       | 5     | 5      | 5    | 5         | digit five             |
|          |       |        |      |           | -                      |
| 54<br>55 | 6     | 6<br>7 | 6    | 6         | digit six              |
| 55       | 7     | -      | 7    | 7         | digit seven            |
| 56       | 8     | 8      | 8    | 8         | digit eight            |
| 57       | 9     | 9      | 9    | 9         | digit nine             |
| 58       | :     | :      | :    | :         | colon                  |
| 59       | ;     | ;      | ;    | ;         | semicolon              |
| 60       | <     | <      | <    | <         | less-than sign         |
| 61       | =     | =      | =    | =         | equals sign            |
| 62       | >     | >      | >    | >         | greater-than sign      |
| 63       | ?     | ?      | ?    | ?         | question mark          |

## The ASCII Character Set

ASCII uses the values from 0 to 31 (and 127) for control characters.

ASCII uses the values from 32 to 126 for letters, digits, and symbols.

ASCII does not use the values from 128 to 255.

# The ANSI Character Set (Windows-1252)

ANSI is identical to ASCII for the values from 0 to 127.

ANSI has a proprietary set of characters for the values from 128 to 159.

ANSI is identical to UTF-8 for the values from 160 to 255.

### The ISO-8859-1 Character Set

ISO-8859-1 is identical to ASCII for the values from 0 to 127.

ISO-8859-1 does not use the values from 128 to 159.

ISO-8859-1 is identical to UTF-8 for the values from 160 to 255.

## The UTF-8 Character Set

UTF-8 is identical to ASCII for the values from 0 to 127.

UTF-8 does not use the values from 128 to 159.Â

UTF-8 is identical to both ANSI and 8859-1 for the values from 160 to 255.

UTF-8 continues from the value 256 with more than 10 000 different characters.

For a closer look, study our Complete HTML Character Set Reference.

# **HTML Uniform Resource Locators**

A URL is another word for a web address.

A URL can be composed of words (e.g. w3schools.com), or an Internet Protocol (IP) address (e.g. 192.68.20.50).

Most people enter the name when surfing, because names are easier to remember than numbers.

## **URL - Uniform Resource Locator**

Web browsers request pages from web servers by using a URL.

A Uniform Resource Locator (URL) is used to address a document (or other data) on the web.

A web address like https://www.w3schools.com/html/default.asp follows these syntax rules:

scheme://prefix.domain:port/path/filename

#### Explanation:

- scheme defines the type of Internet service (most common is http or https)
- prefix defines a domain prefix (default for http is www)
- domain defines the Internet domain name (like w3schools.com)
- port defines the port number at the host (default for http is 80)
- path defines a path at the server (If omitted: the root directory of the site)
- filename defines the name of a document or resource

### **Common URL Schemes**

The table below lists some common schemes:

| Scheme | Short for                          | Used for                        |
|--------|------------------------------------|---------------------------------|
| http   | HyperText Transfer Protocol        | Common web pages. Not encrypted |
| https  | Secure HyperText Transfer Protocol | Secure web pages. Encrypted     |
| ftp    | File Transfer Protocol             | Downloading or uploading files  |
| file   | Â                                  | A file on your computer         |
|        |                                    |                                 |

# **URL Encoding**

URLs can only be sent over the Internet using the ASCII character-set. If a URL contains characters outside the ASCII set, the URL has to be converted.

URL encoding converts non-ASCII characters into a format that can be transmitted over the Internet.

URL encoding replaces non-ASCII characters with a "%" followed by hexadecimal digits.

URLs cannot contain spaces. URL encoding normally replaces a space with a plus (+) sign, or %20.

# Try It Yourself

If you click "Submit", the browser will URL encode the input before it is sent to the server.

A page at the server will display the received input.

Try some other input and click Submit again.

# **ASCII Encoding Examples**

Your browser will encode input, according to the character-set used in your page.

The default character-set in HTML5 is UTF-8.

| Character          | From Windows-<br>1252 | From UTF-8 |
|--------------------|-----------------------|------------|
| âÂ,¬               | %80                   | %E2%82%AC  |
| Ã,£                | %A3                   | %C2%A3     |
| Ã,©                | %A9                   | %C2%A9     |
| Ã,®                | %AE                   | %C2%AE     |
| À                  | %C0                   | %C3%80     |
| ÃÂ                 | %C1                   | %C3%81     |
| ÃÂ,                | %C2                   | %C3%82     |
| Ã <i>f</i> Âf      | %C3                   | %C3%83     |
| Ä                  | %C4                   | %C3%84     |
| $	ilde{A}f\hat{A}$ | %C5                   | %C3%85     |

# HTML Versus XHTML

XHTML is a stricter, more XML-based version of HTML.

### What is XHTML?

- XHTML stands for EXtensible HyperText Markup Language
- XHTML is a stricter, more XML-based version of HTML
- XHTML is HTML defined as an XML application
- · XHTML is supported by all major browsers

# Why XHTML?

XML is a markup language where all documents must be marked up correctly (be "well-formed").

XHTML was developed to make HTML more extensible and flexible to work with other data formats (such as XML). In addition, browsers ignore errors in HTML pages, and try to display the website even if it has some errors in the markup. So XHTML comes with a much stricter error handling.

If you want to study XML, please read our XML Tutorial.

# The Most Important Differences from HTML

- <!DOCTYPE> is mandatory
- The xmlns attribute in <html> is mandatory
- <html>, <head>, <title>, and <body> are mandatory
- Elements must always be properly nested
- · Elements must always be closed
- Elements must always be in lowercase
- · Attribute names must always be in lowercase
- Attribute values must always be quoted
- Attribute minimization is forbidden

# XHTML - <!DOCTYPE ....> Is Mandatory

An XHTML document must have an XHTML <!DOCTYPE> declaration.

The <html>, <head>, <title>, and <body> elements must also be present, and the xmlns attribute in <html> must specify the xml namespace for the document.

#### **Example**

Here is an XHTML document with a minimum of required tags:Â

À some content here...

</body>

# **XHTML Elements Must be Properly Nested**

In XHTML, elements must always be properly nested within each other, like this:

#### **Correct:**

<b><i>Some text</i></b>

#### Wrong:

<b><i>Some text</b></i>

# **XHTML Elements Must Always be Closed**

In XHTML, elements must always be closed, like this:

### **Correct:**

```
This is a paragraph
This is another paragraph
```

### Wrong:

This is a paragraphThis is another paragraph

# **XHTML Empty Elements Must Always be Closed**

In XHTML, empty elements must always be closed, like this:

#### Correct:

A break: <br/>A horizontal rule: <hr/>

An image: <img src="happy.gif" alt="Happy face" />

### Wrong:

A break: <br/>
A horizontal rule: <hr>

An image: <img src="happy.gif" alt="Happy face">

#### XHTML Elements Must be in Lowercase

In XHTML, element names must always be in lowercase, like this:

#### **Correct:**

<br/><body><br/>This is a paragraph</body>

#### Wrong:

<BODY>
<P>This is a paragraph</P>
</BODY>

### **XHTML Attribute Names Must be in Lowercase**

In XHTML, attribute names must always be in lowercase, like this:

#### **Correct:**

| <a <="" href="httr&lt;/th&gt;&lt;th&gt;os://www.w3sch&lt;/th&gt;&lt;th&gt;ools com/html/" th=""><th>&gt;Visit our F</th><th>HTML tutorial</th></a> | >Visit our F | HTML tutorial |                |                         |
|--|--------------|---------------|----------------|-------------------------|
| ~α ιποι <del>-</del> πιιι  |              |               | / V 1311 UU1 1 | I I IVIL tutoriai \/ a/ |

### Wrong:

<a HREF="https://www.w3schools.com/html/">Visit our HTML tutorial</a>

### XHTML Attribute Values Must be Quoted

In XHTML, attribute values must always be quoted, like this:

#### **Correct:**

<a href="https://www.w3schools.com/html/">Visit our HTML tutorial</a>

### Wrong:

<a href=https://www.w3schools.com/html/>Visit our HTML tutorial</a>

## XHTML Attribute Minimization is Forbidden

In XHTML, attribute minimization is forbidden:

#### **Correct:**

```
<input type="checkbox" name="vehicle" value="car" checked="checked" />
<input type="text" name="lastname" disabled="disabled" />
```

### Wrong:

<input type="checkbox" name="vehicle" value="car" checked />
<input type="text" name="lastname" disabled />

### Validate HTML With The W3C Validator

Put your web address in the box below:

https://www.w3schools.com/html/html\_validate.html

Validate the page

# **HTML Forms**

An HTML form is used to collect user input. The user input is most often sent to a server for processing.

### **Example**

First name:

John

Last name:

Doe

Submit

## The <form> Element

The HTML <form> element is used to create an HTML form for user input:
<form>
.
form elements
.
</form>

The <form> element is a container for different types of input elements, such as: text fields, checkboxes, radio buttons, submit buttons, etc.

All the different form elements are covered in this chapter: HTML Form Elements.

# The <input> Element

The HTML <input> element is the most used form element.

An <input> element can be displayed in many ways, depending on the type attribute.

Here are some examples:

Type Description

<input type="text"> Displays a single-line text input field

<input type="radio"> Displays a radio button (for selecting one of many choices)

<input type="checkbox"> Displays a checkbox (for selecting zero or more of many choices)

<input type="submit"> Displays a submit button (for submitting the form)

<input type="button"> Displays a clickable button

All the different input types are covered in this chapter: HTML Input Types.

## **Text Fields**

The <input type="text"> defines a single-line input field for text input.

### Example

A form with input fields for text:

<form>

A <label for="fname">First name:</label><br>

 $\hat{A}$  <input type="text" id="fname" name="fname"><br>

A < label for="lname">Last name:</label><br>

 $\hat{A}$  <input type="text" id="lname" name="lname">

</form>

This is how the HTML code above will be displayed in a browser:

First name:

Last name:

Note: The form itself is not visible. Also note that the default width of an input field is 20 characters.

# The < label > Element

Notice the use of the <abel> element in the example above.

The <label> tag defines a label for many form elements.

The <label> element is useful for screen-reader users, because the screen-reader will read out loud the label when the user focus on the input element.

The <label> element also help users who have difficulty clicking on very small regions (such as radio buttons or checkboxes) - because when the user clicks the text within the <label> element, it toggles the radio button/checkbox.

The for attribute of the <label> tag should be equal to the id attribute of the <input> element to bind them together.

### **Radio Buttons**

The <input type="radio"> defines a radio button.

Radio buttons let a user select ONE of a limited number of choices.

### **Example**

A form with radio buttons:

<form>

A <input type="radio" id="male" name="gender" value="male">

<label for="male">Male</label><br>

<input type="radio" id="female" name="gender" value="female">

A < label for="female">Female</label><br>

A <input type="radio" id="other" name="gender" value="other">

A < label for="other">Other</label>

</form>

This is how the HTML code above will be displayed in a browser:

- Male
- Female
- Other

### **Checkboxes**

The <input type="checkbox"> defines a checkbox.

Checkboxes let a user select ZERO or MORE options of a limited number of choices.

### **Example**

A form with checkboxes:

<form>

<input type="checkbox" id="vehicle1" name="vehicle1" value="Bike">

A <label for="vehicle1"> I have a bike</label><br>

<input type="checkbox" id="vehicle2" name="vehicle2" value="Car">

A <label for="vehicle2"> I have a car</label><br>

 $\hat{A}$  <input type="checkbox" id="vehicle3" name="vehicle3" value="Boat">

 $\mathring{\mathsf{A}}$  <label for="vehicle3"> I have a boat</label>

</form>

This is how the HTML code above will be displayed in a browser:

| I | nave | а | DIKE |
|---|------|---|------|
|   |      |   |      |

☐ I have a car

☐ I have a boat

## The Submit Button

The <input type="submit"> defines a button for submitting the form data to a form-handler.

The form-handler is typically a file on the server with a script for processing input data.

The form-handler is specified in the form's action attribute.

### **Example**

A form with a submit button:

| <f< th=""><th>form action="/action_page.php"&gt;</th></f<> | form action="/action_page.php">  |
|--|--|
| Â  | <label for="fname">First name:</label>                                   |
| Â  | <input id="fname" name="fname" type="text" value="John"/>                |
| Â  | <label for="lname">Last name:</label>                                    |
| Â  | <pre><input id="lname" name="lname" type="text" value="Doe"/><br/></pre> |
| Â  | <input type="submit" value="Submit"/>                                    |
| </td <td>form&gt;</td>                                     | form>  |

This is how the HTML code above will be displayed in a browser:

First name:	
John	
Last name:	_
Doe	
	_
Submit	

# The Name Attribute for <input>

Notice that each input field must have a name attribute to be submitted.

If the name attribute is omitted, the value of the input field will not be sent at all.

### **Example**

This example will not submit the value of the "First name" input field:Â

```
<form action="/action_page.php">
 <label for="fname">First name:</label><br>
 <input type="text" id="fname" value="John"><br>
 <input type="submit" value="Submit">
</form>
```

### **HTML Exercises**

# **HTML Form Attributes**

This chapter describes the different attributes for the HTML<form> element.

### The Action Attribute

The action attribute defines the action to be performed when the form is submitted.

Usually, the form data is sent to a file on the server when the user clicks on the submit button.

In the example below, the form data is sent to a file called "action\_page.php". This file contains a server-side script that handles the form data:

#### **Example**

On submit, send form data to "action\_page.php":

```
<form action="/action_page.php">
 <label for="fname">First name:</label><br>
 <input type="text" id="fname" name="fname" value="John"><br>
 <label for="lname">Last name:</label><br>
 <input type="text" id="lname" name="lname" value="Doe"><br>>
 <input type="submit" value="Submit"></form>
```

# **The Target Attribute**

The target attribute specifies where to display the response that is received after submitting the form.

The target attribute can have one of the following values:

Value	Description
_blank	The response is displayed in a new window or tab
_self	The response is displayed in the current window
_parent	The response is displayed in the parent frame
_top	The response is displayed in the full body of the window
framename	The response is displayed in a named iframe

The default value is \_self which means that the response will open in the current window.

#### **Example**

Here, the submitted result will open in a new browser tab:

<form action="/action\_page.php" target="\_blank">

### The Method Attribute

The method attribute specifies the HTTP method to be used when submitting the form data.

The form-data can be sent as URL variables (withmethod="get") or as HTTP post transaction (with method="post").

The default HTTP method when submitting form data is GET.Â

### Example

This example uses the GET method when submitting the form data:

<form action="/action\_page.php" method="get">

#### **Example**

This example uses the POST method when submitting the form data:

<form action="/action\_page.php" method="post">

#### **Notes on GET:**

- · Appends the form data to the URL, in name/value pairs
- NEVER use GET to send sensitive data! (the submitted form data is visible in the URL!)
- The length of a URL is limited (2048 characters)
- · Useful for form submissions where a user wants to bookmark the result
- GET is good for non-secure data, like query strings in Google

#### **Notes on POST:**

- Appends the form data inside the body of the HTTP request (the submitted form data is not shown in the URL)
- POST has no size limitations, and can be used to send large amounts of data.
- Form submissions with POST cannot be bookmarked

**Tip:** Always use POST if the form data contains sensitive or personal information!

# The Autocomplete Attribute

The autocomplete attribute specifies whether a form should have autocomplete on or off.

When autocomplete is on, the browser automatically complete values based on values that the user has entered before.

### **Example**

A form with autocomplete on:

<form action="/action\_page.php" autocomplete="on">

### The Novalidate Attribute

The novalidate attribute is a boolean attribute.

When present, it specifies that the form-data (input) should not be validated when submitted.

### **Example**

A form with a novalidate attribute:

<form action="/action\_page.php" novalidate>

### **HTML Exercises**

## List of All <form> Attributes

Attribute Description

accept-charset Specifies the character encodings used for form submission
 action Specifies where to send the form-data when a form is submitted
 autocomplete Specifies whether a form should have autocomplete on or off

Specifies how the form-data should be encoded when submitting it to the server (only for method "post")

method="post")

method Specifies the HTTP method to use when sending form-data

name Specifies the name of the form

<u>novalidate</u> Specifies that the form should not be validated when submitted

rel Specifies the relationship between a linked resource and the current document target Specifies where to display the response that is received after submitting the form

# **HTML Form Elements**

This chapter describes all the different HTML form elements.

### The HTML <form> Elements

The HTML <form> element can contain one or more of the following form elements:

- <input>
- <label>
- <select>
- <textarea>
- <button>
- <fieldset>
- <legend>
- <datalist>
- <output>
- <option>
- <optgroup>

# The <input> Element

One of the most used form element is the <input> element.

The <input> element can be displayed in several ways, depending on the type attribute.

### **Example**

```
<label for="fname">First name:</label>
<input type="text" id="fname" name="fname">
```

All the different values of thetype attribute are covered in the next chapter: HTML Input Types.

### The < label > Element

The <label> element defines a label for several form elements.

The <label> element is useful for screen-reader users, because the screen-reader will read out loud the label when the user focus on the input element.

The <label> element also help users who have difficulty clicking on very small regions (such as radio buttons or checkboxes) - because when the user clicks the text within the <label> element, it toggles the radio button/checkbox.

The for attribute of the <label> tag should be equal to the id attribute of the <input> element to bind them together.

#### The <select> Element

The <select> element defines a drop-down list:

#### **Example**

```
<label for="cars">Choose a car:</label>
<select id="cars" name="cars">
 <option value="volvo">Volvo</option>
 <option value="saab">Saab</option>
 <option value="fiat">Fiat</option>
 <option value="audi">Audi</option></select>
```

The <option> elements defines an option that can be selected.

By default, the first item in the drop-down list is selected.

To define a pre-selected option, add the selected attribute to the option:

#### **Example**

<option value="fiat" selected>Fiat</option>

#### **Visible Values:**

Use the size attribute to specify the number of visible values:

### **Example**

```
<label for="cars">Choose a car:</label>
<select id="cars" name="cars" size="3">
 <option value="volvo">Volvo</option>
 <option value="saab">Saab</option>
 <option value="fiat">Fiat</option>
 <option value="audi">Audi</option>
</select>
```

#### **Allow Multiple Selections:**

Use the multiple attribute to allow the user to select more than one value:

#### **Example**

```
<label for="cars">Choose a car:</label>
<select id="cars" name="cars" size="4" multiple>
 <option value="volvo">Volvo</option>
 <option value="saab">Saab</option>
 <option value="fiat">Fiat</option>
 <option value="audi">Audi</option></select>
```

### The <textarea> Element

The <textarea> element defines a multi-line input field (a text area):

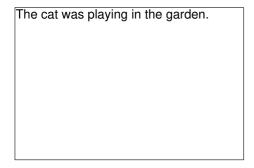

### **Example**

<textarea name="message" rows="10" cols="30"> The cat was playing in the garden. </textarea>

The rows attribute specifies the visible number of lines in a text area.

The cols attribute specifies the visible width of a text area.

This is how the HTML code above will be displayed in a browser:

You can also define the size of the text area by using CSS:

# **Example**

<textarea name="message" style="width:200px; height:600px;">
The cat was playing in the garden.
</textarea>

# The <button> Element

The <button> element defines a clickable button:

### **Example**

<button type="button" onclick="alert('Hello World!')">Click Me!</button>

This is how the HTML code above will be displayed in a browser:

Click Me!

**Note:** Always specify the type attribute for the button element. Different browsers may use different default types for the button element.

# The <fieldset> and <legend> Elements

The <fieldset> element is used to group related data in a form.

The <legend> element defines a caption for the <fieldset> element.

#### **Example**

This is how the HTML code above will be displayed in a browser:

Personalia:		
First name:		
John		
Last name:		
Doe		
Submit		

## The <datalist> Element

The <datalist> element specifies a list of pre-defined options for an<input> element.

Users will see a drop-down list of the pre-defined options as they input data.

The list attribute of the <input> element, must refer to theid attribute of the <datalist> element.

### **Example**

```
<form action="/action_page.php">
 <input list="browsers">
 <datalist id="browsers">
 Â Â <option value="Internet Explorer">
 Â Â <option value="Firefox">
 Â Â <option value="Chrome">
 Â A <option value="Opera">
 Â <option value="Opera">
 Â A <option value="Safari">
 A </datalist>
</form>
```

# The <output> Element

The <output> element represents the result of a calculation (like one performed by a script).

## **Example**

Perform a calculation and show the result in an<output> element:

```
<form action="/action_page.php"
 oninput="x.value=parseInt(a.value)+parseInt(b.value)">
 0
 <input type="range"Â id="a" name="a" value="50">
 100 +
 <input type="number" id="b" name="b" value="50">
 =
 <output name="x" for="a b"></output>
 <br>> chr> chr>
 <input type="submit"></form>
```

### **HTML Exercises**

## **HTML Form Elements**

Tag	Description
<form></form>	Defines an HTML form for user input
<input/>	Defines an input control
<textarea>&lt;/th&gt;&lt;th&gt;Defines a multiline input control (text area)&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;label&gt;&lt;/th&gt;&lt;th&gt;Defines a label for an &lt;input&gt; element&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;pre&gt;&lt;fieldset&gt;&lt;/pre&gt;&lt;/th&gt;&lt;td&gt;Groups related elements in a form&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;legend&gt;&lt;/th&gt;&lt;th&gt;Defines a caption for a &lt;fieldset&gt; element&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;select&gt;&lt;/th&gt;&lt;th&gt;Defines a drop-down list&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;optgroup&gt;&lt;/th&gt;&lt;th&gt;Defines a group of related options in a drop-down list&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;option&gt;&lt;/th&gt;&lt;th&gt;Defines an option in a drop-down list&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;but&gt;&lt;/th&gt;&lt;th&gt;Defines a clickable button&lt;/th&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;datalist&gt;&lt;/th&gt;&lt;td&gt;Specifies a list of pre-defined options for input controls&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;th&gt;&lt;output&gt;&lt;/th&gt;&lt;td&gt;Defines the result of a calculation&lt;/td&gt;&lt;/tr&gt;&lt;/tbody&gt;&lt;/table&gt;</textarea>	

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Input Types**

This chapter describes the different types for the HTML<input> element.

# **HTML Input Types**

Here are the different input types you can use in HTML:

- <input type="button">
- <input type="checkbox">
- <input type="color">
- <input type="date">
- <input type="datetime-local">
- <input type="email">
- <input type="file">
- <input type="hidden">
- <input type="image">
- <input type="month">
- <input type="number">
- <input type="password">
- <input type="radio">
- <input type="range">
- <input type="reset">
- <input type="search">
- <input type="submit">
- <input type="tel">
- <input type="text">
- <input type="time">
- <input type="url">
- <input type="week">

**Tip:** The default value of the type attribute is "text".

# **Input Type Text**

<input type="text"> defines a single-line text input field:

## **Example**

<form> <label for="fname">First name:</label>  <input id="fname" name="fname" type="text"/>  <label for="lname">Last name:</label>  <input id="lname" name="lname" type="text"/>&lt;</form>
This is how the HTML code above will be displayed in a browser:
First name:  Last name:
Input Type Password
<input type="password"/> defines a password field:
Example
<form> <label for="username">Username:</label>  <input id="username" name="username" type="text"/>  <input id="pwd" name="pwd" password"="" type="password:&lt;/label&gt;&lt;br&gt; &lt;input type="/>&lt;</form>
This is how the HTML code above will be displayed in a browser:
Username: Password:
The characters in a password field are masked (shown as asterisks or circles).
Input Type Submit
<pre><input type="submit"/> defines a button for submitting form data to a form-handler.</pre>
The form-handler is typically a server page with a script for processing input data.
The form-handler is specified in the form's action attribute:
Example
<form action="/action_page.php"> <label for="fname">First name:</label>  <input id="fname" name="fname" type="text" value="John"/>  <label for="lname">Last name:</label>  <input id="lname" name="lname" type="text" value="Doe"/>  <input type="submit" value="Submit"/></form>

Doe

Submit

First name: John Last name:

If you omit the submit button's value attribute, the button will get a default text:

This is how the HTML code above will be displayed in a browser:

### **Example**

```
<form action="/action_page.php">
 <label for="fname">First name:</label><br>
 <input type="text" id="fname" name="fname" value="John"><br>
 <label for="lname">Last name:</label><br>
 <input type="text" id="lname" name="lname" value="Doe"><br>
 <input type="submit"><</form>
```

# **Input Type Reset**

<input type="reset"> defines a reset button that will reset all form values to their default values:

#### **Example**

```
<form action="/action_page.php">
 <label for="fname">First name:</label><br>
 <input type="text" id="fname" name="fname" value="John"><br>
 <input type="text" id="fname" name:</label><br>
 <input type="text" id="lname" name="lname" value="Doe"><br>>
 <input type="submit" value="Submit">
 <input type="reset"><</form>
```

This is how the HTML code above will be displayed in a browser:

First name:				
John				
Last name:				
Doe				
Submit	Reset			

If you change the input values and then click the "Reset" button, the form-data will be reset to the default values.

# **Input Type Radio**

<input type="radio"> defines a radio button.

Radio buttons let a user select ONLY ONE of a limited number of choices:

#### **Example**

This is how the HTML code above will be displayed in a browser:

- Male
- Female
- Other

# Input Type Checkbox

<input type="checkbox"> defines a checkbox.

Checkboxes let a user select ZERO or MORE options of a limited number of choices.

### **Example**

<form> <input id="vehicle1" name="vehicle1" type="checkbox" value="Bike"/> <input id="vehicle1" name="vehicle1" type="checkbox" value="Bike"/> <label for="vehicle1"> I have a bike</label>  <input id="vehicle2" name="vehicle2" type="checkbox" value="Car"/> <label for="vehicle2"> I have a car</label>  <input id="vehicle3" name="vehicle3" type="checkbox" value="Boat"/> <label for="vehicle3"> I have a boat</label>&lt;</form>		
This is how the HTML code above will be displayed in a browser:		
☐ I have a bike ☐ I have a car ☐ I have a boat		
Input Type Button		
<input type="button"/> defines a <b>button</b> :		
Example		
<input onclick="alert('Hello World!')" type="button" value="Click Me!"/>		

# **Input Type Color**

The <input type="color"> is used for input fields that should contain a color.

This is how the HTML code above will be displayed in a browser:

Depending on browser support, a color picker can show up in the input field.

### **Example**

Click Me!

<form>

A <a href="lavcolor">Select your favorite color:</a>

<input type="color" id="favcolor" name="favcolor">

</form>

# **Input Type Date**

The <input type="date"> is used for input fields that should contain a date.

Depending on browser support, a date picker can show up in the input field.

### **Example**

<form>

<label for="birthday">Birthday:</label>

<input type="date" id="birthday" name="birthday"> </form>

You can also use the min and max attributes to add restrictions to dates:

### **Example**

<form>

< label for="datemax">Enter a date before 1980-01-01:</label>

Å <input type="date" id="datemax" name="datemax" max="1979-12-31"><br><br>

< label for="datemin">Enter a date after 2000-01-01:</label>

 $\hat{A}$  <input type="date" id="datemin" name="datemin" min="2000-01-02">

</form>

# Input Type Datetime-local

The <input type="datetime-local"> specifies a date and time input field, with no time zone.

Depending on browser support, a date picker can show up in the input field.

#### **Example**

<form>

A <label for="birthdaytime">Birthday (date and time):</label>

<input type="datetime-local" id="birthdaytime" name="birthdaytime">

</form>

# **Input Type Email**

The <input type="email"> is used for input fields that should contain an e-mail address.

Depending on browser support, the e-mail address can be automatically validated when submitted.

Some smartphones recognize the email type, and add ".com" to the keyboard to match email input.

#### Example

<form>

 $\hat{A}$  <label for="email">Enter your email:</label>

<input type="email" id="email" name="email">

</form>

# **Input Type File**

The <input type="file"> defines a file-select field and a "Browse" button for file uploads.

### **Example**

<form>

< label for="myfile">Select a file:</label>

A <input type="file" id="myfile" name="myfile">

</form>

# **Input Type Hidden**

The <input type="hidden"> defines a hidden input field (not visible to a user).

A hidden field let web developers include data that cannot be seen or modified by users when a form is submitted.

A hidden field often stores what database record that needs to be updated when the form is submitted.

**Note:** While the value is not displayed to the user in the page's content, it is visible (and can be edited) using any browser's developer tools or "View Source" functionality. Do not use hidden inputs as a form of security!

### **Example**

<form>

A <label for="fname">First name:</label>

<input type="text" id="fname" name="fname"><br><br>

A <input type="hidden" id="custld" name="custld" value="3487">

A <input type="submit" value="Submit">

</form>

# **Input Type Month**

The <input type="month"> allows the user to select a month and year.

Depending on browser support, a date picker can show up in the input field.

### **Example**

<form>

A <label for="bdaymonth">Birthday (month and year):</label>

A <input type="month" id="bdaymonth" name="bdaymonth">

</form>

# **Input Type Number**

The <input type="number"> defines a numeric input field.

You can also set restrictions on what numbers are accepted.

The following example displays a numeric input field, where you can enter a value from 1 to 5:

#### **Example**

<form>

A <label for="quantity">Quantity (between 1 and 5):</label>

A <input type="number" id="quantity" name="quantity" min="1" max="5">

</form>

# **Input Restrictions**

Here is a list of some common input restrictions:

Attribute	Description
checked	Specifies that an input field should be pre-selected when the page loads (for type="checkbox" or type="radio")
disabled	Specifies that an input field should be disabled
max	Specifies the maximum value for an input field
maxlength	Specifies the maximum number of character for an input field
min	Specifies the minimum value for an input field
pattern	Specifies a regular expression to check the input value against
readonly	Specifies that an input field is read only (cannot be changed)
required	Specifies that an input field is required (must be filled out)
size	Specifies the width (in characters) of an input field
step	Specifies the legal number intervals for an input field
value	Specifies the default value for an input field

You will learn more about input restrictions in the next chapter.

The following example displays a numeric input field, where you can enter a value from 0 to 100, in steps of 10. The default value is 30:

#### **Example**

<form>

<label for="quantity">Quantity:</label>

<input type="number" id="quantity" name="quantity" min="0" max="100" step="10" value="30">

</form>

# Input Type Range

The <input type="range"> defines a control for entering a number whose exact value is not important (like a slider control). Default range is 0 to 100. However, you can set restrictions on what numbers are accepted with the min, max, and step attributes:

### **Example**

<form>

<label for="vol">Volume (between 0 and 50):</label>

<input type="range" id="vol" name="vol" min="0" max="50">

</form>

# **Input Type Search**

The <input type="search"> is used for search fields (a search field behaves like a regular text field).

### **Example**

<form>
 <label for="gsearch">Search Google:</label>
 <input type="search" id="gsearch" name="gsearch">
//orm>

# **Input Type Tel**

The <input type="tel"> is used for input fields that should contain a telephone number.

### **Example**

<form>  $\hat{A}$  <|abel for="phone">Enter your phone number:</|label>  $\hat{A}$  <|input type="tel" id="phone" name="phone" pattern="[0-9]{3}-[0-9]{2}-[0-9]{3}"> </form>

# **Input Type Time**

The <input type="time"> allows the user to select a time (no time zone).

Depending on browser support, a time picker can show up in the input field.

### **Example**

```
<form>
 <label for="appt">Select a time:</label>
 <input type="time" id="appt" name="appt">
</form>
```

# **Input Type Url**

The <input type="url"> is used for input fields that should contain a URL address.

Depending on browser support, the url field can be automatically validated when submitted.

Some smartphones recognize the url type, and adds ".com" to the keyboard to match url input.

### Example

```
<form>
 <label for="homepage">Add your homepage:</label>
 <input type="url" id="homepage" name="homepage">
</form>
```

# **Input Type Week**

The <input type="week"> allows the user to select a week and year.

Depending on browser support, a date picker can show up in the input field.

#### **Example**

```
<form>
 <label for="week">Select a week:</label>
 <input type="week" id="week" name="week">
</form>
```

# **HTML Input Type Attribute**

Tag Description

≤input Specifies the input type to

type=""> display

# **HTML Input Attributes**

This chapter describes the different attributes for the HTML<input> element.

## The value Attribute

The input value attribute specifies an initial value for an input field:

## Example

Input fields with initial (default) values:

<form>

 $\hat{A}$  < label for="fname">First name:</label><br>

A <input type="text" id="fname" name="fname" value="John"><br>

<label for="Iname">Last name:</label><br>

A <input type="text" id="lname" name="lname" value="Doe">

</form>

# The readonly Attribute

The input readonly attribute specifies that an input field is read-only.

A read-only input field cannot be modified (however, a user can tab to it, highlight it, and copy the text from it).

The value of a read-only input field will be sent when submitting the form!

#### **Example**

A read-only input field:

<form>

A <label for="fname">First name:</label><br

<input type="text" id="fname" name="fname" value="John" readonly><br>

A <label for="Iname">Last name:</label><br>

 $\hat{A}$  <input type="text" id="Iname" name="Iname" value="Doe">

</form>

### The disabled Attribute

The input disabled attribute specifies that an input field should be disabled.

A disabled input field is unusable and un-clickable.

The value of a disabled input field will not be sent when submitting the form!

#### **Example**

A disabled input field:

<form>

A <label for="fname">First name:</label><br>
 <input type="text" id="fname" name="fname" value="John" disabled><br>
 <label for="lname">Last name:</label><br>
 <input type="text" id="lname" name="lname" value="Doe">
</form>

### The size Attribute

The input size attribute specifies the visible width, in characters, of an input field.

The default value for size is 20.

Note: The size attribute works with the following input types: text, search, tel, url, email, and password.

#### **Example**

Set a width for an input field:

<form>

A <label for="fname">First name:</label><br>

<input type="text" id="fname" name="fname" size="50"><br>

A < label for="pin">PIN:</label><br>

A <input type="text" id="pin" name="pin" size="4">

</form>

# The maxlength Attribute

The input maxlength attribute specifies the maximum number of characters allowed in an input field.

**Note:** When a maxlength is set, the input field will not accept more than the specified number of characters. However, this attribute does not provide any feedback. So, if you want to alert the user, you must write JavaScript code.

### **Example**

Set a maximum length for an input field:

<form>

A <label for="fname">First name:</label><br>

 $\hat{A}$  <input type="text" id="fname" name="fname" size="50"><br>

 $\hat{A}$  < label for="pin">PIN:</label><br/>br>

 $\hat{A}$  <input type="text" id="pin" name="pin" maxlength="4" size="4">

</form>

### The min and max Attributes

The input min and max attributes specify the minimum and maximum values for an input field.

The min and max attributes work with the following input types: number, range, date, datetime-local, month, time and week.

Tip: Use the max and min attributes together to create a range of legal values.

### **Example**

Set a max date, a min date, and a range of legal values:

```
<form>
```

< label for="datemax">Enter a date before 1980-01-01:</label>

<input type="date" id="datemax" name="datemax" max="1979-12-31"><br><br>

A <a href="datemin">Enter a date after 2000-01-01:</a>

<input type="date" id="datemin" name="datemin" min="2000-01-02"><br>

A <label for="quantity">Quantity (between 1 and 5):</label>

<input type="number" id="quantity" name="quantity" min="1" max="5">

</form>

# The multiple Attribute

The input multiple attribute specifies that the user is allowed to enter more than one value in an input field.

The multiple attribute works with the following input types: email, and file.

#### **Example**

A file upload field that accepts multiple values:

<form>

A < label for="files">Select files:</label>

A <input type="file" id="files" name="files" multiple>

</form>

# The pattern Attribute

The input pattern attribute specifies a regular expression that the input field's value is checked against, when the form is submitted.

The pattern attribute works with the following input types: text, date, search, url, tel, email, and password.

Tip: Use the global title attribute to describe the pattern to help the user.

Tip: Learn more about regular expressions in our JavaScript tutorial.

### **Example**

An input field that can contain only three letters (no numbers or special characters):

<form>

<label for="country code">Country code:</label>

<input type="text" id="country\_code" name="country\_code"

A pattern="[A-Za-z]{3}" title="Three letter country code">

</form>

# The placeholder Attribute

The input placeholder attribute specifies a short hint that describes the expected value of an input field (a sample value or a short description of the expected format).

The short hint is displayed in the input field before the user enters a value.

The placeholder attribute works with the following input types: text, search, url, tel, email, and password.

#### **Example**

An input field with a placeholder text:

<form>

A <label for="phone">Enter a phone number:</label>

<input type="tel" id="phone" name="phone"

placeholder="123-45-678"

pattern="[0-9]{3}-[0-9]{2}-[0-9]{3}">

</form>

# The required Attribute

The input required attribute specifies that an input field must be filled out before submitting the form.

The required attribute works with the following input types: text, search, url, tel, email, password, date pickers, number, checkbox, radio, and file.

#### **Example**

A required input field:

<form>
 <label for="username">Username:</label>
 <input type="text" id="username" name="username" required>
</form>

# The step Attribute

The input step attribute specifies the legal number intervals for an input field.

Example: if step="3", legal numbers could be -3, 0, 3, 6, etc.

Tip: This attribute can be used together with the max and min attributes to create a range of legal values.

The step attribute works with the following input types: number, range, date, datetime-local, month, time and week.

### **Example**

An input field with a specified legal number intervals:

<form>
 <label for="points">Points:</label>
 <input type="number" id="points" name="points" step="3">
</form>

**Note:** Input restrictions are not foolproof, and JavaScript provides many ways to add illegal input. To safely restrict input, it must also be checked by the receiver (the server)!

## The autofocus Attribute

The input autofocus attribute specifies that an input field should automatically get focus when the page loads.

### **Example**

Let the "First name" input field automatically get focus when the page loads:

<form>

A <label for="fname">First name:</label><br>

<input type="text" id="fname" name="fname" autofocus><br>

A <label for="Iname">Last name:</label><br>

A <input type="text" id="lname" name="lname">

</form>

# The height and width Attributes

The input height and width attributes specify the height and width of an<input type="image"> element.

**Tip:** Always specify both the height and width attributes for images. If height and width are set, the space required for the image is reserved when the page is loaded. Without these attributes, the browser does not know the size of the image, and cannot reserve the appropriate space to it. The effect will be that the page layout will change during loading (while the images load).

### **Example**

Define an image as the submit button, with height and width attributes:

<form>

< label for="fname">First name: </ label>

A <input type="text" id="fname" name="fname"><br><br>

< label for="Iname">Last name: </ label>

<input type="text" id="lname" name="lname"><br><br><br>

<input type="image" src="img\_submit.gif" alt="Submit" width="48" height="48"> </form>

The list Attribute

The input list attribute refers to a <datalist> element that contains pre-defined options for an <input> element.

#### **Example**

An <input> element with pre-defined values in a <datalist>:

<form>
 <input list="browsers">
 <datalist id="browsers">
 <datalist id="browsers">
 Â Â <option value="Internet Explorer">
 Â <option value="Firefox">
 Â <option value="Chrome">
 Â <option value="Opera">
 Â <option value="Safari">
 </datalist>
</form>

# The autocomplete Attribute

The input autocomplete attribute specifies whether a form or an input field should have autocomplete on or off.

Autocomplete allows the browser to predict the value. When a user starts to type in a field, the browser should display options to fill in the field, based on earlier typed values.

The autocomplete attribute works with <form> and the following <input> types: text, search, url, tel, email, password, datepickers, range, and color.

# **Example**

An HTML form with autocomplete on, and off for one input field:

<form action="/action\_page.php" autocomplete="on">
 <label for="fname">First name:</label>
 <input type="text" id="fname" name="fname"><br>>cbr>
 <label for="lname">Last name:</label>
 <input type="text" id="lname" name="lname"><br>>cbr>
 <label for="email">Email:</label>
 <input type="email" id="email" name="email" autocomplete="off"><br>>cbr>
 <input type="submit" value="Submit">

/form>

**Tip:** In some browsers you may need to activate an autocomplete function for this to work (Look under "Preferences" in the browser's menu).

## **HTML Exercises**

# **HTML Form and Input Elements**

Tag Description

<form> Defines an HTML form for user input

<input> Defines an input control</ti>

For a complete list of all available HTML tags, visit our <u>HTML Tag Reference</u>.

# **HTML Input form\* Attributes**

This chapter describes the different form\* attributes for the HTML <input> element.

## The form Attribute

The input form attribute specifies the form the <input> element belongs to.

The value of this attribute must be equal to the id attribute of the <form> element it belongs to.

### **Example**

An input field located outside of the HTML form (but still a part of the form):

```
<form action="/action_page.php" id="form1">
 <label for="fname">First name:</label>
 <input type="text" id="fname" name="fname"><br><br><\hat{A} <input type="submit" value="Submit"><</form>
<label for="lname">Last name:</label><<input type="text" id="lname" name="lname" form="form1"></form>
```

### The formaction Attribute

The input formaction attribute specifies the URL of the file that will process the input when the form is submitted.

**Note:** This attribute overrides the action attribute of the <form> element.

The formaction attribute works with the following input types: submit and image.

#### Example

</form>

An HTML form with two submit buttons, with different actions:

```
<form action="/action_page.php">
 <label for="fname">First name:</label>
 <input type="text" id="fname" name="fname"><br>
 <label for="lname">Last name:</label>
 <input type="text" id="lname" name="lname"><br>
 <input type="submit" value="Submit">
 <input type="submit" value="Submit">
 <input type="submit" formaction="/action_page2.php" value="Submit as Admin">
```

# The formenctype Attribute

The input formenctype attribute specifies how the form-data should be encoded when submitted (only for forms with method="post").

**Note:** This attribute overrides the enctype attribute of the<form> element.

The formenctype attribute works with the following input types: submit and image.

## **Example**

A form with two submit buttons. The first sends the form-data with default encoding, the second sends the form-data encoded as "multipart/form-data":

```
<form action="/action_page_binary.asp" method="post">
 <label for="fname">First name:</label>
 <input type="text" id="fname" name="fname"><br><br>À <input type="submit" value="Submit">
 <input type="submit" formenctype="multipart/form-data"
 value="Submit as Multipart/form-data">
</form>
```

#### The formmethod Attribute

The input formmethod attribute defines the HTTP method for sending form-data to the action URL.

Note: This attribute overrides the method attribute of the <form> element.

The formmethod attribute works with the following input types: submit and image.

The form-data can be sent as URL variables (method="get") or as an HTTP post transaction (method="post").

#### Notes on the "get" method:

- This method appends the form-data to the URL in name/value pairs
- · This method is useful for form submissions where a user want to bookmark the result
- There is a limit to how much data you can place in a URL (varies between browsers), therefore, you cannot be sure that all of the form-data will be correctly transferred
- Never use the "get" method to pass sensitive information! (password or other sensitive information will be visible in the browser's address bar)

#### Notes on the "post" method:

- This method sends the form-data as an HTTP post transaction
- · Form submissions with the "post" method cannot be bookmarked
- The "post" method is more robust and secure than "get", and "post" does not have size limitations

#### **Example**

A form with two submit buttons. The first sends the form-data with method="get". The second sends the form-data with method="post":

<form action="/action\_page.php" method="get">

A <label for="fname">First name:</label>

<input type="text" id="fname" name="fname"><br><br>

A <label for="Iname">Last name:</label>

<input type="text" id="lname" name="lname"><br><br>

A <input type="submit" value="Submit using GET">

A <input type="submit" formmethod="post" value="Submit using POST">

</form>

# The formtarget Attribute

The input formtarget attribute specifies a name or a keyword that indicates where to display the response that is received after submitting the form.

**Note:** This attribute overrides the target attribute of the <form> element.

The formtarget attribute works with the following input types: submit and image.

### Example

A form with two submit buttons, with different target windows:

<form action="/action\_page.php">

A <label for="fname">First name:</label>

<input type="text" id="fname" name="fname"><br><br>

A <label for="Iname">Last name:</label>

<input type="text" id="lname" name="lname"><br><br><br>

<input type="submit" value="Submit">

<input type="submit" formtarget="\_blank" value="Submit to a new window/tab">

</form>

### The formnovalidate Attribute

The input formnovalidate attribute specifies that an <input> element should not be validated when submitted.

Note: This attribute overrides the novalidate attribute of the <form> element.

The formnovalidate attribute works with the following input types: submit.

#### **Example**

A form with two submit buttons (with and without validation):

<form action="/action\_page.php">

 $\mathring{A}$  <label for="email">Enter your email:</label>

 $\hat{A}$  <input type="email" id="email" name="email"><br><br>

A <input type="submit" value="Submit">

A <input type="submit" formnovalidate="formnovalidate"

A value="Submit without validation">

</form>

### The novalidate Attribute

The novalidate attribute is a <form> attribute.

When present, novalidate specifies that all of the form-data should not be validated when submitted.

### **Example**

Specify that no form-data should be validated on submit:

<form action="/action\_page.php" novalidate>

 $\hat{A}$  <label for="email">Enter your email:</label>

<input type="email" id="email" name="email"><br><br>

A <input type="submit" value="Submit">

</form>

# **HTML Form and Input Elements**

Tag Description

<form> input Defines an HTML form for user

<input> Defines an input control

For a complete list of all available HTML tags, visit our HTML Tag Reference.

# **HTML Canvas Graphics**

The HTML <canvas> element is used to draw graphics on a web page.

The graphic to the left is created with<canvas>. It shows four elements: a red rectangle, a gradient rectangle, a multicolor rectangle, and a multicolor text.

### What is HTML Canvas?

The HTML <canvas> element is used to draw graphics, on the fly, via JavaScript.

The <canvas> element is only a container for graphics. You must use JavaScript to actually draw the graphics.

Canvas has several methods for drawing paths, boxes, circles, text, and adding images.

# **Browser Support**

The numbers in the table specify the first browser version that fully supports the <canvas> element.

#### Element

9.0 2.0 3.1 9.0 <canvas> 4.0

# **Canvas Examples**

A canvas is a rectangular area on an HTML page. By default, a canvas has no border and no content.

The markup looks like this:

<canvas id="myCanvas" width="200" height="100"></canvas>

**Note:** Always specify an id attribute (to be referred to in a script), and a width and height attribute to define the size of the canvas. To add a border, use the style attribute.

Here is an example of a basic, empty canvas:

### **Example**

<canvas id="myCanvas" width="200" height="100" style="border:1px solid #000000;">
</canvas>

# Add a JavaScript

After creating the rectangular canvas area, you must add a JavaScript to do the drawing.

Here are some examples:

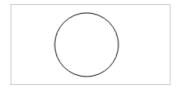

#### Draw a Line

### **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");
ctx.moveTo(0, 0);
ctx.lineTo(200, 100);
ctx.stroke();
</script>
```

#### **Draw a Circle**

### **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");
ctx.beginPath();
ctx.arc(95, 50, 40, 0, 2 * Math.PI);
ctx.stroke();
</script>
```

#### **Draw a Text**

# Hello World

### **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");
ctx.font = "30px Arial";
ctx.fillText("Hello World", 10, 50);
</script>
```

#### **Stroke Text**

Hello World

### **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");
ctx.font = "30px Arial";
ctx.strokeText("Hello World", 10, 50);
</script>
```

### **Draw Linear Gradient**

## **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");

// Create gradient
var grd = ctx.createLinearGradient(0, 0, 200, 0);
grd.addColorStop(0, "red");
grd.addColorStop(1, "white");

// Fill with gradient
ctx.fillStyle = grd;
ctx.fillRect(10, 10, 150, 80);
</script>
```

### **Draw Circular Gradient**

## **Example**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");

// Create gradient
var grd = ctx.createRadialGradient(75, 50, 5, 90, 60, 100);
grd.addColorStop(0, "red");
grd.addColorStop(1, "white");

// Fill with gradient
ctx.fillStyle = grd;
ctx.fillRect(10, 10, 150, 80);
</script>
```

### **Draw Image**

```
<script>
var c = document.getElementById("myCanvas");
var ctx = c.getContext("2d");
var img = document.getElementById("scream");
ctx.drawImage(img, 10, 10);
</script>
```

## **HTML Canvas Tutorial**

To learn more about <canvas>, please read our HTML Canvas Tutorial.

# **HTML SVG Graphics**

SVG defines vector-based graphics in XML format.

## What is SVG?

- SVG stands for Scalable Vector Graphics
- · SVG is used to define graphics for the Web
- SVG is a W3C recommendation

# The HTML <svg> Element

The HTML <svg> element is a container for SVG graphics.

SVG has several methods for drawing paths, boxes, circles, text, and graphic images.

# **Browser Support**

The numbers in the table specify the first browser version that fully supports the <svg> element.

#### **Element**

<svg> 4.0 9.0 3.0 3.2 10.1

## **SVG Circle**

## **Example**

```
<!DOCTYPE html>
<html>
<body>
<svg width="100" height="100">
 <circle cx="50" cy="50" r="40" stroke="green" stroke-width="4" fill="yellow" />
</svg>
</body>
</html>
```

# **SVG Rectangle**

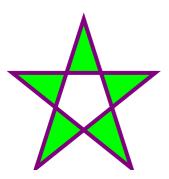

## **Example**

# **SVG Rounded Rectangle**

## **Example**

## **SVG Star**

#### **Example**

<svg width="300" height="200"> <polygon points="100,10 40,198 190,78 10,78 160,198" style="fill:lime;stroke:purple;stroke-width:5;fill-rule:evenodd;" /> </svg>

## **SVG Logo**

## **Example**

<svg height="130" width="500">  $\hat{A} <$ defs>  $\hat{A} \hat{A} \hat{A} <$ linearGradient id="grad1" x1="0%" y1="0%" x2="100%" y2="0%">  $\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} <$ stop offset="0%" style="stop-color:rgb(255,255,0);stop-opacity:1" />  $\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} \hat{A} <$ stop offset="100%" style="stop-color:rgb(255,0,0);stop-opacity:1" />  $\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} \hat{A} <$ stop offset="100%" style="stop-color:rgb(255,0,0);stop-opacity:1" />  $\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} = 0$  //linearGradient>  $\hat{A} = 0$  //defs>  $\hat{A} = 0$  /defs>  $\hat{A} = 0$  /defs>  $\hat{A} = 0$  /defs="100" cy="70" rx="85" ry="55" fill="url(#grad1)" />  $\hat{A} = 0$  /cext fill="#ffffff" font-size="45" font-family="Verdana" x="50" y="86">SVG</text>  $\hat{A} = 0$  Sorry, your browser does not support inline SVG. </svg>

### **Differences Between SVG and Canvas**

SVG is a language for describing 2D graphics in XML.

Canvas draws 2D graphics, on the fly (with a JavaScript).

SVG is XML based, which means that every element is available within the SVG DOM. You can attach JavaScript event handlers for an element.

In SVG, each drawn shape is remembered as an object. If attributes of an SVG object are changed, the browser can automatically re-render the shape.

Canvas is rendered pixel by pixel. In canvas, once the graphic is drawn, it is forgotten by the browser. If its position should be changed, the entire scene needs to be redrawn, including any objects that might have been covered by the graphic.

# **Comparison of Canvas and SVG**

The table below shows some important differences between Canvas and SVG:

Canvas SVG

- · Resolution dependent
- · No support for event handlers
- · Poor text rendering capabilities
- You can save the resulting image as .png or .jpg
- · Well suited for graphic-intensive games

- · Resolution independent
- Support for event handlers
- Best suited for applications with large rendering areas (Google Maps)
- Slow rendering if complex (anything that uses the DOM a lot will be slow)
- · Not suited for game applications

## **SVG Tutorial**

To learn more about SVG, please read our SVG Tutorial.

# **HTML Multimedia**

Multimedia on the web is sound, music, videos, movies, and animations.

### What is Multimedia?

Multimedia comes in many different formats. It can be almost anything you can hear or see, like images, music, sound, videos, records, films, animations, and more.

Web pages often contain multimedia elements of different types and formats.

# **Browser Support**

The first web browsers had support for text only, limited to a single font in a single color.

Later came browsers with support for colors, fonts, images, and multimedia!

### **Multimedia Formats**

Multimedia elements (like audio or video) are stored in media files.

The most common way to discover the type of a file, is to look at the file extension.

Multimedia files have formats and different extensions like: .wav, .mp3, .mp4, .mpg, .wmv, and .avi.

## **Common Video Formats**

Videoformats	There are many video formats out there.	
	The MP4, WebM, and Ogg formats are supported by HTML.	
	The MP4 format is recommended by YouTube.	

Format	File	Description
MPEG	.mpg .mpeg	MPEG. Developed by the Moving Pictures Expert Group. The first popular video format on the web. Not supported anymore in HTML.
AVI	.avi	AVI (Audio Video Interleave). Developed by Microsoft. Commonly used in video cameras and TV hardware. Plays well on Windows computers, but not in web browsers.
WMV	.wmv	WMV (Windows Media Video). Developed by Microsoft. Commonly used in video cameras and TV hardware. Plays well on Windows computers, but not in web browsers.

QuickTime	e .mov	QuickTime. Developed by Apple. Commonly used in video cameras and TV hardware. Plays well on Apple computers, but not in web browsers.
RealVideo	.rm .ram	RealVideo. Developed by Real Media to allow video streaming with low bandwidths. Does not play in web browsers.
Flash	.swf .flv	Flash. Developed by Macromedia. Often requires an extra component (plug-in) to play in web browsers.
Ogg	.ogg	Theora Ogg. Developed by the Xiph.Org Foundation. Supported by HTML.
WebM	.webm	WebM. Developed by Mozilla, Opera, Adobe, and Google. Supported by HTML.
MPEG-4 or MP4	.mp4	MP4. Developed by the Moving Pictures Expert Group. Commonly used in video cameras and TV hardware. Supported by all browsers and recommended by YouTube.Â

Note: Only MP4, WebM, and Ogg video are supported by the HTML standard.

## **Common Audio Formats**

MP3 is the best format for compressed recorded music. The term MP3 has become synonymous with digital music.

If your website is about recorded music, MP3 is the choice.

Format	File	Description
N/III ) I	.mid .midi	MIDI (Musical Instrument Digital Interface). Main format for all electronic music devices like synthesizers and PC sound cards. MIDI files do not contain sound, but digital notes that can be played by electronics. Plays well on all computers and music hardware, but not in web browsers.
RealAudio	.rm .ram	RealAudio. Developed by Real Media to allow streaming of audio with low bandwidths. Does not play in web browsers.
WMA	.wma	WMA (Windows Media Audio). Developed by Microsoft. Plays well on Windows computers, but not in web browsers.
AAC	.aac	AAC (Advanced Audio Coding). Developed by Apple as the default format for iTunes. Plays well on Apple computers, but not in web browsers.
WAV	.wav	WAV. Developed by IBM and Microsoft. Plays well on Windows, Macintosh, and Linux operating systems. Supported by HTML.
Ogg	.ogg	Ogg. Developed by the Xiph.Org Foundation. Supported by HTML.
MP3	.mp3	MP3 files are actually the sound part of MPEG files. MP3 is the most popular format for music players. Combines good compression (small files) with high quality. Supported by all browsers.
MP4	.mp4	MP4 is a video format, but can also be used for audio. Supported by all browsers.

Note: Only MP3, WAV, and Ogg audio are supported by the HTML standard.

# **HTML Video**

The HTML <video> element is used to show a video on a web page.

## **Example**

Courtesy of Big Buck Bunny:

Your browser does not support HTML5 video.

## The HTML < video > Element

To show a video in HTML, use the < video > element:

### **Example**

<video width="320" height="240" controls> <source src="movie.mp4" type="video/mp4"> <source src="movie.ogg" type="video/ogg"> Your browser does not support the video tag. </video>

### **How it Works**

The controls attribute adds video controls, like play, pause, and volume.

It is a good idea to always include width and height attributes. If height and width are not set, the page might flicker while the video loads.

The <source> element allows you to specify alternative video files which the browser may choose from. The browser will use the first recognized format.

The text between the <video> and </video> tags will only be displayed in browsers that do not support the <video> element.

# HTML < video > Autoplay

To start a video automatically, use the autoplay attribute:

#### **Example**

```
<video width="320" height="240" autoplay>
 <source src="movie.mp4" type="video/mp4">
 <source src="movie.ogg" type="video/ogg">
Your browser does not support the video tag.
</video>
```

Note: Chromium browsers do not allow autoplay in most cases. However, muted autoplay is always allowed.

Add muted after autoplay to let your video start playing automatically (but muted):

### **Example**

```
<video width="320" height="240" autoplay muted>
 <source src="movie.mp4" type="video/mp4">
 <source src="movie.ogg" type="video/ogg">
Your browser does not support the video tag.
</video>
```

# **Browser Support**

The numbers in the table specify the first browser version that fully supports the <video> element.

#### **Element**

<video> 4.0 9.0 3.5 4.0 10.5

### **HTML Video Formats**

There are three supported video formats: MP4, WebM, and Ogg. The browser support for the different formats is:

Browser	MP4	WebM	Ogg
Edge	YES	YES	YES
Chrome	YES	YES	YES
Firefox	YES	YES	YES
Safari	YES	YES	NO
Opera	YES	YES	YES

# **HTML Video - Media Types**

File Media Format Type MP4 video/mp4 WebM video/webm Ogg video/ogg

# HTML Video - Methods, Properties, and Events

The HTML DOM defines methods, properties, and events for the <video> element.

This allows you to load, play, and pause videos, as well as setting duration and volume.

There are also DOM events that can notify you when a video begins to play, is paused, etc.

**Example: Using JavaScript** 

Your browser does not support HTML5 video.

Video courtesy of Big Buck Bunny.

For a full DOM reference, go to our HTML Audio/Video DOM Reference.

# **HTML Video Tags**

Tag Description

<u><video></u>
Defines a video or movie

Defines multiple media resources for media elements, such as <video> and

<audio>

<u><track></u>
Defines text tracks in media players

# **HTML Audio**

The HTML <audio> element is used to play an audio file on a web page.

### The HTML <audio> Element

To play an audio file in HTML, use the<audio> element:

### **Example**

<audio controls>

A <source src="horse.ogg" type="audio/ogg">

<source src="horse.mp3" type="audio/mpeg">

Your browser does not support the audio element.

</audio>

### **HTML Audio - How It Works**

The controls attribute adds audio controls, like play, pause, and volume.

The <source> element allows you to specify alternative audio files which the browser may choose from. The browser will use the first recognized format.

The text between the <audio> and </audio> tags will only be displayed in browsers that do not support the <audio> element.

# **HTML <audio> Autoplay**

To start an audio file automatically, use the autoplay attribute:

### **Example**

<audio controls autoplay> <source src="horse.ogg" type="audio/ogg"> <source src="horse.mp3" type="audio/mpeg"> Your browser does not support the audio element. </audio>

Note: Chromium browsers do not allow autoplay in most cases. However, muted autoplay is always allowed.

Add muted after autoplay to let your audio file start playing automatically (but muted):

### **Example**

<audio controls autoplay muted>
 <source src="horse.ogg" type="audio/ogg">
 <source src="horse.mp3" type="audio/mpeg">
Your browser does not support the audio element.
</audio>

# **Browser Support**

The numbers in the table specify the first browser version that fully supports the <audio> element.

#### Element

<audio> 4.0 9.0 3.5 4.0 10.5

## **HTML Audio Formats**

There are three supported audio formats: MP3, WAV, and OGG. The browser support for the different formats is:Â

Browser	MP3	WAV	OGG
Edge/IE	YES	YES*	YES*
Chrome	YES	YES	YES
Firefox	YES	YES	YES
Safari	YES	YES	NO
Opera	YES	YES	YES

<sup>\*</sup>From Edge 79

# **HTML Audio - Media Types**

File	Media
Format	Type
MP3	audio/mpeg
OGG	audio/ogg
WAV	audio/wav

# HTML Audio - Methods, Properties, and Events

The HTML DOM defines methods, properties, and events for the <audio> element.

This allows you to load, play, and pause audios, as well as set duration and volume.

There are also DOM events that can notify you when an audio begins to play, is paused, etc.

For a full DOM reference, go to our HTML Audio/Video DOM Reference.

# **HTML Audio Tags**

Tag Description

<audio> Defines sound content

Defines multiple media resources for media elements, such as <video> and

<audio>

# **HTML Plug-ins**

Plug-ins are computer programs that extend the standard functionality of the browser.

# Plug-ins

Plug-ins were designed to be used for many different purposes:

- · To run Java applets
- To run Microsoft ActiveX controls
- To display Flash movies
- To display maps
- · To scan for viruses
- · To verify a bank id

#### Warning!

Most browsers no longer support Java Applets and Plug-ins.

ActiveX controls are no longer supported in any browsers.

The support for Shockwave Flash has also been turned off in modern browsers.

# The <object> Element

The <object> element is supported by all browsers.

The <object> element defines an embedded object within an HTML document.

It was designed to embed plug-ins (like Java applets, PDF readers, and Flash Players) in web pages, but can also be used to include HTML in HTML:

#### **Example**

<object width="100%" height="500px" data="snippet.html"></object>

Or images if you like:

### **Example**

<object data="audi.jpeg"></object>

## The <embed> Element

The <embed> element is supported in all major browsers.

The <embed> element also defines an embedded object within an HTML document.

Web browsers have supported the <embed> element for a long time. However, it has not been a part of the HTML specification before HTML5.

### **Example**

<embed src="audi.jpeg">

Note that the <embed> element does not have a closing tag. It can not contain alternative text.

The <embed> element can also be used to include HTML in HTML:

#### **Example**

<embed width="100%" height="500px" src="snippet.html">

# HTML YouTube Videos

The easiest way to play videos in HTML, is to use YouTube.

# Struggling with Video Formats?

Converting videos to different formats can be difficult and time-consuming.

An easier solution is to let YouTube play the videos in your web page.

#### YouTube Video Id

YouTube will display an id (like tgbNymZ7vqY), when you save (or play) a video.

You can use this id, and refer to your video in the HTML code.

# Playing a YouTube Video in HTML

To play your video on a web page, do the following:

- Upload the video to YouTube
- Take a note of the video id
- Define an <iframe> element in your web page
- Let the src attribute point to the video URL
- Use the width and height attributes to specify the dimension of the player
- · Add any other parameters to the URL (see below)

## Example

<iframe width="420" height="315"
src="https://www.youtube.com/embed/tgbNymZ7vqY">
</iframe>

# YouTube Autoplay + Mute

You can let your video start playing automatically when a user visits the page, by adding autoplay=1 to the YouTube URL. However, automatically starting a video is annoying for your visitors!

Note: Chromium browsers do not allow autoplay in most cases. However, muted autoplay is always allowed.

Add mute=1 after autoplay=1 to let your video start playing automatically (but muted).

### YouTube - Autoplay + Muted

<iframe width="420" height="315"
src="https://www.youtube.com/embed/tgbNymZ7vqY?autoplay=1&mute=1">
</iframe>

# YouTube Playlist

# YouTube Loop

Add loop=1 to let your video loop forever.

Value 0 (default): The video will play only once.

Value 1: The video will loop (forever).

#### YouTube - Loop

<iframe width="420" height="315"
src="https://www.youtube.com/embed/tgbNymZ7vqY?playlist=tgbNymZ7vqY&loop=1">
</iframe>

## YouTube Controls

Add controls=0 to not display controls in the video player.

Value 0: Player controls does not display.

Value 1 (default): Player controls display.

#### YouTube - Controls

<iframe width="420" height="315"
src="https://www.youtube.com/embed/tgbNymZ7vqY?controls=0">
</iframe>

# **HTML Geolocation API**

The HTML Geolocation API is used to locate a user's position.

### Locate the User's Position

The HTML Geolocation API is used to get the geographical position of a user.

Since this can compromise privacy, the position is not available unless the user approves it.

Try It

Note: Geolocation is most accurate for devices with GPS, like smartphones.

# **Browser Support**

The numbers in the table specify the first browser version that fully supports Geolocation.

API

5.0 - 49.0

Geolocation (http) 9.0 3.5 5.0 16.0

50.0 (https)

**Note:** As of Chrome 50, the Geolocation API will only work on secure contexts such as HTTPS. If your site is hosted on an non-secure origin (such as HTTP) the requests to get the users location will no longer function.

# **Using HTML Geolocation**

The getCurrentPosition() method is used to return the user's position.

The example below returns the latitude and longitude of the user's position:

#### **Example**

Example explained:

- · Check if Geolocation is supported
- If supported, run the getCurrentPosition() method. If not, display a message to the user
- If the getCurrentPosition() method is successful, it returns a coordinates object to the function specified in the parameter (showPosition)
- The showPosition() function outputs the Latitude and Longitude

The example above is a very basic Geolocation script, with no error handling.

# **Handling Errors and Rejections**

The second parameter of the <code>getCurrentPosition()</code> method is used to handle errors. It specifies a function to run if it fails to get the user's location:

#### **Example**

```
function showError(error) { \hat{A} \hat{A} switch(error.code) { \hat{A} \hat{A} \hat{A} case error.PERMISSION_DENIED: \hat{A} \hat{A}
```

# Displaying the Result in a Map

To display the result in a map, you need access to a map service, like Google Maps.

In the example below, the returned latitude and longitude is used to show the location in a Google Map (using a static image):

### **Example**

```
function showPosition(position) { Â Â var latlon = position.coords.latitude + "," + position.coords.longitude;
```

```
 Â var img_url = "https://maps.googleapis.com/maps/api/staticmap?center= Â Â "+latlon+"&zoom=14&size=400x300&sensor=false&key=YOUR_KEY";

 Â document.getElementById("mapholder").innerHTML = "<img src=""+img_url+"">";
}
```

# **Location-specific Information**

This page has demonstrated how to show a user's position on a map.

Geolocation is also very useful for location-specific information, like:

- · Up-to-date local information
- Showing Points-of-interest near the user
- Turn-by-turn navigation (GPS)

# The getCurrentPosition() Method - Return Data

The getCurrentPosition() method returns an object on success. The latitude, longitude and accuracy properties are always returned. The other properties are returned if available:

Property	Returns
coords.latitude	The latitude as a decimal number (always returned)
coords.longitude	The longitude as a decimal number (always returned)
coords.accuracy	The accuracy of position (always returned)
coords.altitude	The altitude in meters above the mean sea level (returned if available)
coords.altitudeAccurac	y The altitude accuracy of position (returned if available)
coords.heading	The heading as degrees clockwise from North (returned if available)
coords.speed	The speed in meters per second (returned if available)
timestamp	The date/time of the response (returned if available)

# **Geolocation Object - Other interesting Methods**

The Geolocation object also has other interesting methods:

- watchPosition() Returns the current position of the user and continues to return updated position as the user moves (like the GPS in a car).
- clearWatch() Stops the watchPosition() method.

The example below shows the watchPosition() method. You need an accurate GPS device to test this (like smartphone):

#### **Example**

# **HTML Drag and Drop API**

In HTML, any element can be dragged and dropped.

# **Example**

Drag the W3Schools image into the rectangle.

# **Drag and Drop**

Drag and drop is a very common feature. It is when you "grab" an object and drag it to a different location.

# **Browser Support**

The numbers in the table specify the first browser version that fully supports Drag and Drop.

3.5

**API** 

Drag and Drop 4.0

9.0

6.0

12.0

# **HTML Drag and Drop Example**

The example below is a simple drag and drop example:

### **Example**

```
<!DOCTYPE HTML>
<html>
<head>
<script>
function allowDrop(ev) {
 Â ev.preventDefault();
function drag(ev) {
A ev.dataTransfer.setData("text", ev.target.id);
function drop(ev) {
A ev.preventDefault();
 Â var data = ev.dataTransfer.getData("text");
ÄÄ ev.target.appendChild(document.getElementByld(data));
</script>
</head>
<body>
<div id="div1" ondrop="drop(event)" ondragover="allowDrop(event)"></div>
<img id="drag1" src="img_logo.gif" draggable="true" ondragstart="drag(event)" width="336" height="69">
</body>
</html>
```

It might seem complicated, but lets go through all the different parts of a drag and drop event.

# Make an Element Draggable

First of all: To make an element draggable, set thedraggable attribute to true:

```
<img draggable="true">
```

# What to Drag - ondragstart and setData()

Then, specify what should happen when the element is dragged.

In the example above, the ondragstart attribute calls a function, drag(event), that specifies what data to be dragged.

The dataTransfer.setData() method sets the data type and the value of the dragged data:

```
 \begin{array}{ll} \text{function drag(ev) } \{ \\ \hat{A} & \text{ev.dataTransfer.setData("text", ev.target.id);} \\ \} \end{array}
```

In this case, the data type is "text" and the value is the id of the draggable element ("drag1").

## Where to Drop - ondragover

The ondragover event specifies where the dragged data can be dropped.

By default, data/elements cannot be dropped in other elements. To allow a drop, we must prevent the default handling of the element.

This is done by calling the event.preventDefault() method for the ondragover event:

event.preventDefault()

# Do the Drop - ondrop

When the dragged data is dropped, a drop event occurs.

In the example above, the ondrop attribute calls a function, drop(event):

```
function drop(ev) {
    Â ev.preventDefault();
    Â var data = ev.dataTransfer.getData("text");
    Â ev.target.appendChild(document.getElementByld(data));
}
```

Code explained:

- Call preventDefault() to prevent the browser default handling of the data (default is open as link on drop)
- Get the dragged data with the dataTransfer.getData() method. This method will return any data that was set to the same type in the setData() method
- The dragged data is the id of the dragged element ("drag1")
- · Append the dragged element into the drop element

# **More Examples**

#### **Example**

How to drag (and drop) an image back and forth between two <div> elements:

# **HTML Web Storage API**

# What is HTML Web Storage?

With web storage, web applications can store data locally within the user's browser.

Before HTML5, application data had to be stored in cookies, included in every server request. Web storage is more secure, and large amounts of data can be stored locally, without affecting website performance.

Unlike cookies, the storage limit is far larger (at least 5MB) and information is never transferred to the server.

Web storage is per origin (per domain and protocol). All pages, from one origin, can store and access the same data.

# **Browser Support**

The numbers in the table specify the first browser version that fully supports Web Storage.

#### **API**

Web Storage 4.0

8.0

3.5

4.0 11.5

# **HTML Web Storage Objects**

HTML web storage provides two objects for storing data on the client:

- · window.localStorage stores data with no expiration date
- window.sessionStorage stores data for one session (data is lost when the browser tab is closed)

Before using web storage, check browser support for localStorage and sessionStorage:

```
if (typeof(Storage) !== "undefined") {
 // Code for localStorage/sessionStorage.
} else {
 // Sorry! No Web Storage support..
}
```

# The localStorage Object

The localStorage object stores the data with no expiration date. The data will not be deleted when the browser is closed, and will be available the next day, week, or year.

### **Example**

```
// Store localStorage.setItem("lastname", "Smith");

// Retrieve document.getElementById("result").innerHTML = localStorage.getItem("lastname");
```

Example explained:

- Create a localStorage name/value pair with name="lastname" and value="Smith"
- Retrieve the value of "lastname" and insert it into the element with id="result"

The example above could also be written like this:

```
// Store localStorage.lastname = "Smith"; // Retrieve document.getElementById("result").innerHTML = localStorage.lastname;
```

The syntax for removing the "lastname" localStorage item is as follows:

localStorage.removeItem("lastname");

Note: Name/value pairs are always stored as strings. Remember to convert them to another format when needed!

The following example counts the number of times a user has clicked a button. In this code the value string is converted to a number to be able to increase the counter:

#### Example

```
if (localStorage.clickcount) {
    Â localStorage.clickcount = Number(localStorage.clickcount) + 1;
} else {
    Â localStorage.clickcount = 1;
} document.getElementById("result").innerHTML = "You have clicked the button " + localStorage.clickcount + " time(s).";
```

# The sessionStorage Object

The sessionStorage object is equal to the localStorage object, **except** that it stores the data for only one session. The data is deleted when the user closes the specific browser tab.

The following example counts the number of times a user has clicked a button, in the current session:

#### **Example**

```
if (sessionStorage.clickcount) {
    Â sessionStorage.clickcount = Number(sessionStorage.clickcount) + 1;
} else {
    Â sessionStorage.clickcount = 1;
} document.getElementById("result").innerHTML = "You have clicked the button " + sessionStorage.clickcount + " time(s) in this session.";
```

# **HTML Web Workers API**

A web worker is a JavaScript running in the background, without affecting the performance of the page.

### What is a Web Worker?

When executing scripts in an HTML page, the page becomes unresponsive until the script is finished.

A web worker is a JavaScript that runs in the background, independently of other scripts, without affecting the performance of the page. You can continue to do whatever you want: clicking, selecting things, etc., while the web worker runs in the background.

# **Browser Support**

The numbers in the table specify the first browser version that fully support Web Workers.

#### API

Web Workers 4.0 10.0 3.5 4.0 11.5

# **HTML Web Workers Example**

The example below creates a simple web worker that count numbers in the background:

#### Example

Count numbers:

Start Worker St

Stop Worker

# **Check Web Worker Support**

Before creating a web worker, check whether the user's browser supports it:

```
if (typeof(Worker) !== "undefined") { \hat{A} \hat{A} // Yes! Web worker support! \hat{A} // Some code..... } else { \hat{A} // Sorry! No Web Worker support.. }
```

## Create a Web Worker File

Now, let's create our web worker in an external JavaScript.

Here, we create a script that counts. The script is stored in the "demo\_workers.js" file:

```
var i = 0;
function timedCount() {
 i = i + 1;
 postMessage(i);
 Â setTimeout("timedCount()",500);
}
timedCount();
```

The important part of the code above is the postMessage() method - which is used to post a message back to the HTML page.

Note: Normally web workers are not used for such simple scripts, but for more CPU intensive tasks.

# **Create a Web Worker Object**

Now that we have the web worker file, we need to call it from an HTML page.

The following lines checks if the worker already exists, if not - it creates a new web worker object and runs the code in "demo\_workers.js":

```
if (typeof(w) == "undefined") {
 w = new Worker("demo_workers.js");
}
```

Then we can send and receive messages from the web worker.

Add an "onmessage" event listener to the web worker.

```
w.onmessage = function(event){
 Â document.getElementById("result").innerHTML = event.data;
};
```

When the web worker posts a message, the code within the event listener is executed. The data from the web worker is stored in event.data.

### Terminate a Web Worker

When a web worker object is created, it will continue to listen for messages (even after the external script is finished) until it is terminated.

To terminate a web worker, and free browser/computer resources, use the terminate() method:

w.terminate();

## Reuse the Web Worker

If you set the worker variable to undefined, after it has been terminated, you can reuse the code:

# **Full Web Worker Example Code**

We have already seen the Worker code in the .js file. Below is the code for the HTML page:

#### **Example**

```
<!DOCTYPE html>
<html>
<body>
Count numbers: <output id="result"></output>
<button onclick="startWorker()">Start Worker</button>
<button onclick="stopWorker()">Stop Worker</button>
<script>
var w;
function startWorker() {
A if (typeof(Worker) !== "undefined") {
\hat{A} \hat{A} \hat{A} if (typeof(w) == "undefined") {
\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} \hat{A} = \text{new Worker("demo workers.js");}
ÂÂÂ
\hat{A} \hat{A} \hat{A} \hat{A} w.onmessage = function(event) {
\hat{A} \hat{A} \hat{A} \hat{A} \hat{A} \hat{A} document.getElementByld("result").innerHTML = event.data;
ÂÂÂÂ};
ÂÂ}else {
 Â Â document.getElementById("result").innerHTML = "Sorry! No Web Worker support.";
ÂÂ}
}
function stopWorker() {
 Â w.terminate();
\hat{A} \hat{A} \hat{w} = \text{undefined};
</script>
</body>
</html>
```

### Web Workers and the DOM

Since web workers are in external files, they do not have access to the following JavaScript objects:

- · The window object
- · The document object
- · The parent object

# HTML SSE API

Server-Sent Events (SSE) allow a web page to get updates from a server.

# Server-Sent Events - One Way Messaging

A server-sent event is when a web page automatically gets updates from a server.

This was also possible before, but the web page would have to ask if any updates were available. With server-sent events, the updates come automatically.

Examples: Facebook/Twitter updates, stock price updates, news feeds, sport results, etc.

# **Browser Support**

The numbers in the table specify the first browser version that fully support server-sent events.

#### **API**

SSE 6.0 79.0 6.0 5.0 11.5

### **Receive Server-Sent Event Notifications**

The EventSource object is used to receive server-sent event notifications:

### **Example**

```
var source = new EventSource("demo_sse.php");
source.onmessage = function(event) {
    Â Â document.getElementById("result").innerHTML += event.data + "<br>;
};
```

Example explained:

- Create a new EventSource object, and specify the URL of the page sending the updates (in this example "demo sse.php")
- Each time an update is received, the onmessage event occurs
- When an onmessage event occurs, put the received data into the element with id="result"

# **Check Server-Sent Events Support**

In the tryit example above there were some extra lines of code to check browser support for server-sent events:

```
if(typeof(EventSource) !== "undefined") {
 // Yes! Server-sent events support!
 // Some code.....
} else {
 // Sorry! No server-sent events support...
}
```

# Server-Side Code Example

For the example above to work, you need a server capable of sending data updates (like PHP or ASP).

The server-side event stream syntax is simple. Set the "Content-Type" header to "text/event-stream". Now you can start sending event streams.

```
Code in PHP (demo_sse.php):

<?php
header('Content-Type: text/event-stream');
header('Cache-Control: no-cache');

$time = date('r');
echo "data: The server time is: {$time}\n\n";
flush();
?>

Code in ASP (VB) (demo_sse.asp):

<%
Response.ContentType = "text/event-stream"
Response.Expires = -1
Response.Write("data: The server time is: " & now())
Response.Flush()
%>
```

Code explained:

- Set the "Content-Type" header to "text/event-stream"
- · Specify that the page should not cache
- Output the data to send (Always start with "data: ")
- · Flush the output data back to the web page

## The EventSource Object

In the examples above we used the onmessage event to get messages. But other events are also available:

**Events** Description

onopen When a connection to the server is opened

onmessage When a message is received

onerror When an error occurs

# **HTML Examples**

#### **HTML Basic**

HTML document HTML headings HTML paragraphs HTML links HTML images HTML buttons HTML lists

**Examples explained** 

#### **HTML Attributes**

#### **HTML Comments**

Hidden comments Conditional comments Comments for debugging

**Examples explained** 

#### **HTML CSS**

HTML with inline CSS HTML with internal CSS HTML with external CSS HTML with CSS using the id attribute HTML with CSS using the class attribute HTML and CSS borders HTML and CSS padding HTML and CSS margin HTML and CSS full demo

**Examples explained** 

#### **HTML Links**

Linking, using an absolute URL Linking, using a relative URL Changing the color of links Removing the underline from links Changing the target of a link An image as a link Creating a bookmark link A link that breaks out of a frame A mailto link A mailto link with subject

**Examples explained** 

### **HTML Images**

An image An image height and width using attributes An image height and width using CSS An image height and width using both An image in another folder An image with a broken link An image on another server Using an image as a link A moving image An image map with clickable regions A floating image

**Examples explained** 

#### **HTML Tables**

Basic HTML tables A table with borders A table with collapsed borders A table with cell padding A table with headings A table with left-aligned headings Horizontal/Vertical table headings A table with a caption Table cells that span more than one column Table cells that span more than one row A table with cell spacing A table with HTML tags inside Tables with different style using id I Tables with different style using class ITables with different style using class II

**Examples explained** 

#### **HTML Lists**

An unordered list (default) An unordered list with disc bullets An unordered list with circle bullets An unordered list with square bullets An unordered list without bullets An ordered list (default) An ordered list with numbers An ordered list with letters An ordered list with lowercase letters An ordered list with roman numbers An ordered list with lowercase roman numbers A description list A nested list I A nested list II A horizontal list A horizontal list menu

**Examples explained** 

#### **HTML Block and inline elements**

The <div> element The <span> element Styling a <div> element Styling a <span> element

**Examples explained** 

#### **HTML Classes**

Style all elements with a specified class name Access elements with a specified class name, with JavaScriptMultiple classes Same class, different tag

**Examples explained** 

#### HTML Id

Style an element with a specific id Difference between class and id Access an element with a specific id, with JavaScript

**Examples explained** 

#### **HTML Layout**

Layout using float Layout using flexbox Layout using flexbox 2 Layout using flexbox 3

**Examples explained** 

#### **HTML IFrame**

Inline frame (a frame inside an HTML page)

**Examples explained** 

#### **HTML** head Elements

A valid HTML document with no <a href="https://www.nc.google.com">https://www.nc.google.com</a>, and <a href="https://www.nc.google.com">head> element The <title> element defines the document title The <style> element contains style information The link> element defines a relationship to an external resource The <meta> element defines special meta information The <script> element defines client-side JavaScripts The <br/>
| JavaScr

**Examples explained** 

### **HTML Scripts**

Insert a script Use of the <noscript> tag

**Examples explained** 

### **HTML Computercode Elements**

Keyboard input formatting using the <kbd> elementComputer output formatting using the <samp> elementProgramming code formatting using the <code> element Programming code formatting preserving whitespace and line-breaks Variable formatting using the <var> element

**Examples explained** 

### **HTML Forms**

Form with text input Form with radio button input Form with text fields and a submit buttonForm with a text fields without a name attribute Grouping Form Data

**Examples explained** 

### **HTML Form Elements**

A simple drop-down list A drop-down list with a pre-selected value A textarea (a multi-line text input field) An input button Using the <a href="Using the">Using the</a> <a hre

**Examples explained** 

### **HTML Input Types**

Input type text Input type password Input type radio Input type checkbox Input type button Input type number - with restrictions Input type number - with steps Input type date - with date picker Input type date - with restrictions Input type color - with color picker Input type range Input type month Input type week Input type time Input type datetime Input type datetime Input type email Input type search Input type tel Input type url

**Examples explained** 

#### **HTML Input Attributes**

The autocomplete attribute The novalidate attribute The autofocus\_attribute The form attribute The formaction attribute The formenctype attribute The formmethod attribute The formnovalidate attribute The formtarget attribute The height and width attributes The list attribute The min and max attributes The multiple attribute The pattern attribute The placeholder attribute The required attribute The step attribute

**Examples explained** 

## **HTML Canvas Graphics**

<u>Draw on the canvas with JavaScript Draw a line with lineTo() Draw a circle with arc() Draw a text with fillText() Draw a text with strokeText() Draw a linear gradient Draw a circular gradient Draw an image with drawImage()</u>

**Examples explained** 

## **HTML SVG Graphics**

SVG Circle SVG Rectangle SVG Rounded Rectangle SVG Star SVG Logo

**Examples explained** 

#### **HTML Media**

Play Bunny Play bear video with controls Play bear video with autoplay Play Horse sound with controls

**Examples explained** 

#### **HTML Geolocation**

Get geolocation coordinates Handle geolocation errors Get geolocation and watch the position

Examples explained

### **HTML Local Storage**

Store a name permanently Store a counter permanently Store a counter for one session

**Examples explained** 

#### **HTML Media**

Play a video file Play an audio file in HTML Play a YouTube video in HTML

# **HTML Quiz**

You can test your HTML skills with W3Schools' Quiz.

## The Test

The test contains 40 questions and there is no time limit.Â

The test is not official, it's just a nice way to see how much you know, or don't know, about HTML.

### **Count Your Score**

You will get 1 point for each correct answer. At the end of the Quiz, your total score will be displayed. Maximum score is 40 points.

## Start the Quiz

Good luck!

If you don't know HTML, we suggest that you read our HTML Tutorial from scratch.

# **HTML Exercises**

You can test your HTML skills with W3Schools' Exercises.

## **Exercises**

We have gathered a variety of HTML exercises (with answers) for each HTML Chapter.

Try to solve an exercise by editing some code. Get a "hint" if you're stuck, or show the answer to see what you've done wrong.

## **Count Your Score**

You will get 1 point for each correct answer. Your score and total score will always be displayed.

## **Start HTML Exercises**

Good luck!

If you don't know HTML, we suggest that you read our HTML Tutorial from scratch.

# **W3Schools HTML Certificate**

W3Schools offers an Online Certification Program.

 Â The perfect solution for busy professionals who need to balance work, family, and career building.

More than 25 000 certificates already issued!

### **Document Your Skills**

Knowledge is power, especially in the current job market. Documentation of your skills enables you to advance your career, or help you to start a new one.

### Get a Certificate

Getting a certificate proves your commitment to upgrade your skills, gives you the credibility needed for more responsibilities, larger projects, and a higher salary.

Get Your Certificate »

### **How Does It Work?**

- · Study for free at W3Schools.com
- Study at your own speed
- Test your skills with W3Schools online guizzes
- · Apply for your certificate by paying an exam fee
- · Take your exam online, at any time, and from any location

# You Have Learned HTML, Now What?

# **HTML Summary**

This tutorial has taught you how to use HTML to create your own web site.

HTML is the universal markup language for the Web. HTML lets you format text, add graphics, create links, input forms, frames and tables, etc., and save it all in a text file that any browser can read and display.

For more information on HTML, please take a look at our HTML examples and our HTML reference.

You can also test your HTML skills with HTML Exercises and HTML Quizzes.

## Now You Know HTML, What's Next?

#### Learn CSS

CSS lets you style your HTML pages.

CSS gives you total control of the layout, without messing up the document content.

To learn more about CSS, please visit our CSS tutorial.

# Learn JavaScript

JavaScript makes your website more dynamic. A dynamic website can react to events and allow user interaction.

JavaScript is the most popular scripting language on the internet and it works with all major browsers.

If you want to learn more about JavaScript, please visit our JavaScript tutorial.

# **Publishing Your Website**

To make your website available to the world, you must publish it.

For this, you have two options:

- Use an Internet Service Provider
- Host your own website

# **Using an Internet Service Provider**

An Internet service provider (ISP) is a company that provides services for accessing and using the Internet.

Internet services typically provided by ISPs include Internet access, Internet transit, domain name registration, web hosting, Usenet service, and colocation.

Using an Internet Service Provider (ISP) is the most common option.

## Advantages:

- Connection Speed ISPs have very fast connections to the internet.
- Powerful Hardware ISPs have powerful web servers that can be shared by several clients. You can also expect an
  effective load balancing and necessary backup servers
- Security and Stability ISPs are specialists on web hosting. Expect more than 99% up time, the latest software patches, and the best virus protection

### Things to Consider:

- 24-hour support The ISP should offer 24-hours support. Toll-free phone could also be vital
- Daily Backup The ISP must run a daily backup routine
- Traffic Volume Check the ISP's traffic volume restrictions (do not end up paying a fortune for unexpected high traffic)
- Bandwidth or Content Restrictions Check the ISP's bandwidth and content restrictions (Is it possible to publish pictures, video, or sound?)
- E-mail Capabilities Make sure the ISP supports the e-mail capabilities you need
- Database Access Make sure the ISP supports the database access you need

# **Hosting Your Own Website**

Hosting your own website, on your own server, is also an option.

#### Things to Consider:

- Hardware Expenses To run a "real" web site, you must buy powerful server hardware (a low cost PC will not do the job). You will also need a permanent (24/7) high-speed connection
- Software Expenses Server-licenses are often higher than client-licenses. Server-licenses also might have limits on number of users
- Labor Expenses Don't expect low labor expenses. You have to install your own hardware and software. You also have to deal with bugs and viruses, and keep your server constantly running

# **HTML Accessibility**

# HTML Accessibility

Always write HTML code with accessibility in mind!

Provide the user a good way to navigate and interact with your site. Make your HTML code as semantic as possible.

### Semantic HTML

Semantic HTML means using correct HTML elements for their correct purpose as much as possible. Semantic elements are elements with a meaning; if you need a button, use the <button> element (and not a <div> element).

### Semantic

#### Ion-semantic

div>Click Me</div>

Semantic HTML gives context to screen readers, which read the contents of a page out loud.

With the button example in mind:

- · buttons have more suitable styling by default
- · a screen reader identifies it as a button
- focusable
- clickable

A button is also accessible for people relying on keyboard-only navigation; it can be clickable with both mouse and keys, and it can be tabbed between (using the tab key on the keyboard).

Examples of non-semantic elements: <div> and <span> - Tells nothing about its content.

Examples of semantic elements: <form>, , and <article> - Clearly defines its content.

# **Headings Are Important**

Headings are defined with the <h1> to <h6> tags:

#### **Example**

<h1>Heading 1</h1><h2>Heading 2</h2><h3>Heading 3</h3><h4>Heading 4</h4><h5>Heading 5</h5><h6>Heading 6</h6>

Search engines use the headings to index the structure and content of your web pages.

Users skim your pages by its headings. It is important to use headings to show the document structure and the relationships between different sections.

<h1> headings should be used for main headings, followed by<h2> headings, then the less important <h3>, and so on.

Note: Use HTML headings for headings only. Don't use headings to make text BIG or bold.

### Alternative Text

The alt attribute provides an alternate text for an image, if the user for some reason cannot view it (because of slow connection, an error in the src attribute, or if the user uses a screen reader).

The value of the alt attribute should describe the image:

#### Example

<img src="img\_chania.jpg" alt="Flowers in Chania">

If a browser cannot find an image, it will display the value of thealt attribute:

### **Example**

<img src="wrongname.gif" alt="Flowers in Chania">

# **Declare the Language**

You should always include the lang attribute inside the <a href="html">html</a>> tag, to declare the language of the Web page. This is meant to assist search engines and browsers.

The following example specifies English as the language:

```
<!DOCTYPE html>
<html lang="en">
<body>
...
</body>
</html>
```

# **Use Clear Language**

Always use a clear language, that is easy to understand. Also try to avoid characters that cannot be read clearly by a screen reader. For example:

- · Keep sentences as short as possible
- Avoid dashes. Instead of writing 1-3, write 1 to 3
- Avoid abbreviations. Instead of writing Feb, write February
- · Avoid slang words

## **Create Good Link Text**

A link text should explain clearly what information the reader will get by clicking on that link.

Examples of good and bad links:

#### book

ind out more about the HTML language

lead more about how to eat healthy

buy tickets to Mars here

#### 3ad

lick here

lead more..

uy tickets to Mars here

## The title Attribute

The title attribute specifies extra information about an element.

The information is most often shown as a tooltip text when the mouse moves over the element.

The title attribute can be used on any HTML element (it will validate on any HTML element. However, it is not necessarily useful).

#### **Example**

<abbr title="World Health Organization">WHO</abbr> was founded in 1948.

W3Schools.com

# **HTML Element Reference**

# **HTML Tags Ordered Alphabetically**

Tag

Description

<u><!--...-></u> <u><!DOCTYPE</u>>Â Defines a comment Defines the document type <a> Defines a hyperlink</a>

<acronym>

<abbr> Defines an abbreviation or an acronym

Not supported in HTML5. Use <abbr> instead.

Defines an acronym

<address> Defines contact information for the author/owner of a document

Not supported in HTML5. Use <a href="mailto:cembed"><embed</a> or <a href="cobject"><object</a> instead.

<u><applet></u> Defines an embedded applet

<u><area></u>
Defines an area inside an image map

<article> Defines an article

<aside> Defines content aside from the page content

<audio> Defines embedded sound content

<br/>Defines bold text

Specifies the base URL/target for all relative URLs in a document

Spacefort
Not supported in HTML5. Use CSS instead.

Specifies a default color, size, and font for all text in a document

Lisolates a part of text that might be formatted in a different direction from other text outside it

<bdo> Overrides the current text direction

<br/>Not supported in HTML5. Use CSS instead.

Defines big text

<a href="mailto:square;"><a href="mailto:square;">wbr></a>
<a href="mailto:square;">Defines a possible line-break</a>

# **HTML Attribute Reference**

## **HTML Attribute Reference**

The table below lists all HTML attributes and what elements they can be used within:

Attribute	Belongs to	Description
accept	<u><input/></u>	Specifies the types of files that the server accepts (only for type="file")
accept-charset	<form></form>	Specifies the character encodings that are to be used for the form submission
accesskey	Global Attributes	Specifies a shortcut key to activate/focus an element
action	<form></form>	Specifies where to send the form-data when a form is submitted
align	Not supported in HTML 5.	Specifies the alignment according to surrounding elements. Use CSS instead
<u>alt</u>	<area/> , <img/> , <input/>	Specifies an alternate text when the original element fails to display
async	<script></td><td>Specifies that the script is executed asynchronously (only for external scripts)</td></tr><tr><td><u>autocomplete</u></td><td><form>, <input></td><td>Specifies whether the <form> or the <input> element should have autocomplete enabled</td></tr><tr><td>autofocus</td><td><pre><button>, <input>, <select>, <textarea></pre></td><td>Specifies that the element should automatically get focus when the page loads</td></tr><tr><td>autoplay</td><td><audio>, <video></td><td>Specifies that the audio/video will start playing as soon as it is ready</td></tr><tr><td>bgcolor</td><td>Not supported in HTML 5.</td><td>Specifies the background color of an element. Use CSS instead</td></tr><tr><td>border</td><td>Not supported in HTML 5.</td><td>Specifies the width of the border of an element. Use CSS instead</td></tr><tr><td><u>charset</u></td><td><meta>, <script></td><td>Specifies the character encoding</td></tr><tr><td>checked</td><td><input></td><td>Specifies that an <input> element should be pre-selected when the page loads (for type="checkbox" or type="radio")</td></tr><tr><td><u>cite</u></td><td> <blockquote>, <ale text>, <ins>, <q></a></td><td>Specifies a URL which explains the quote/deleted/inserted text</td></tr><tr><td>class</td><td>Global Attributes</td><td>Specifies one or more classnames for an element (refers to a class in a style sheet)</td></tr></tbody></table></script>	

Specifies the text color of an element. Use CSS color Not supported in HTML 5. instead Specifies the visible width of a text area <u>cols</u> <textarea> Specifies the number of columns a table cell colspan <u>, </u> should span Gives the value associated with the http-equiv content <meta> or name attribute Specifies whether the content of an element is contenteditable **Global Attributes** editable or not Specifies that audio/video controls should be controls <audio>, <video> displayed (such as a play/pause button etc) coords Specifies the coordinates of the area <area> Specifies the URL of the resource to be used by <object> data the object Used to store custom data private to the page **Global Attributes** data-\* or application Specifies the date and time datetime <del>, <ins>, <time> Specifies that the track is to be enabled if the user's preferences do not indicate that another default <track> track would be more appropriate Specifies that the script is executed when the page has finished parsing (only for external <u>defer</u> <script> scripts) Specifies the text direction for the content in an dir **Global Attributes** element Specifies that the text direction will be submitted dirname <input>, <textarea> Specifies that the specified element/group of <button>, <fieldset>, <input>, <optgroup>, disabled <option>, <select>, <textarea> elements should be disabled Specifies that the target will be downloaded download <a>>, <area> when a user clicks on the hyperlink Specifies whether an element is draggable or draggable **Global Attributes** not Specifies how the form-data should be encoded when submitting it to the server (only for enctype <form> method="post") Specifies which form element(s) a <label>, <output> <u>for</u> label/calculation is bound to <button>, <fieldset>, <input>, <label>, Specifies the name of the form the element form <meter>, <object>, <output>, <select>, belongs to <textarea> Specifies where to send the form-data when a formaction form is submitted. Only for type="submit" Specifies one or more headers cells a cell is <u>, </u> <u>headers</u> related to <canvas>, <embed>, <iframe>, <img>, Specifies the height of the element height <input>, <object>, <video> Specifies that an element is not yet, or is no **Global Attributes** hidden longer, relevant Specifies the range that is considered to be a <u>high</u> <meter> high value href <a>, <area>, <base>, , link> Specifies the URL of the page the link goes to Specifies the language of the linked document hreflang <a>, <area>, , link> Provides an HTTP header for the http-equiv <meta> information/value of the content attribute id **Global Attributes** Specifies a unique id for an element ismap <img> Specifies an image as a server-side image map Specifies the kind of text track <u>kind</u> <track> Specifies the title of the text track <u>label</u> <track>, <option>, <optgroup> **Global Attributes** Specifies the language of the element's content lang

list

<input>

Refers to a <datalist> element that contains pre-

defined options for an <input> element

Specifies that the audio/video will start over <audio>, <video> loop again, every time it is finished Specifies the range that is considered to be a <u>low</u> <meter> low value <input>, <meter>, <progress> Specifies the maximum value max Specifies the maximum number of characters maxlength <input>, <textarea> allowed in an element Specifies what media/device the linked <a>, <area>, <link>, <source>, <style> media document is optimized for Specifies the HTTP method to use when method <form> sending form-data <input>, <meter> Specifies a minimum value min Specifies that a user can enter more than one multiple <input>, <select> value Specifies that the audio output of the video <video>, <audio> muted should be muted <button>, <fieldset>, <form>, <iframe>, <input>, <map>, <meta>, <object>, Specifies the name of the element name <output>, <param>, <select>, <textarea> Specifies that the form should not be validated novalidate <form> when submitted <audio>, <embed>, <img>, <object>, Script to be run on abort onabort <video> onafterprint <body> Script to be run after the document is printed onbeforeprint Script to be run before the document is printed <body> Script to be run when the document is about to onbeforeunload <body> be unloaded onblur All visible elements. Script to be run when the element loses focus Script to be run when a file is ready to start oncanplay <audio>, <embed>, <object>, <video> playing (when it has buffered enough to begin) Script to be run when a file can be played all the oncanplaythrough <audio>, <video> way to the end without pausing for buffering Script to be run when the value of the element All visible elements. onchange is changed Script to be run when the element is being onclick All visible elements. clicked Script to be run when a context menu is oncontextmenu All visible elements. triagered Script to be run when the content of the All visible elements. oncopy element is being copied Script to be run when the cue changes in a oncuechange <track> <track> element Script to be run when the content of the All visible elements. oncut element is being cut Script to be run when the element is being ondblclick All visible elements. double-clicked Script to be run when the element is being All visible elements. ondrag dragged ondragend All visible elements. Script to be run at the end of a drag operation Script to be run when an element has been All visible elements. ondragenter dragged to a valid drop target Script to be run when an element leaves a valid ondragleave All visible elements. drop target Script to be run when an element is being ondragover All visible elements. dragged over a valid drop target ondragstart All visible elements. Script to be run at the start of a drag operation Script to be run when dragged element is being All visible elements. ondrop dropped Script to be run when the length of the media

changes

ondurationchange

<audio>, <video>

Script to be run when something bad happens onemptied <audio>, <video> and the file is suddenly unavailable (like unexpectedly disconnects) Script to be run when the media has reach the onended <audio>, <video> end (a useful event for messages like "thanks for listening") <audio>, <body>, <embed>, <img>, Script to be run when an error occurs onerror <object>, <script>, <style>, <video> All visible elements. onfocus Script to be run when the element gets focus Script to be run when there has been changes onhashchange <body> to the anchor part of the a URL Script to be run when the element gets user All visible elements. oninput input oninvalid All visible elements. Script to be run when the element is invalid onkeydown All visible elements. Script to be run when a user is pressing a key <u>onkeypress</u> All visible elements. Script to be run when a user presses a key onkeyup All visible elements. Script to be run when a user releases a key <body>, <iframe>, <img>, <input>, <link>, Script to be run when the element is finished onload <script>, <style> <audio>, <video> onloadeddata Script to be run when media data is loaded Script to be run when meta data (like onloadedmetadata <audio>, <video> dimensions and duration) are loaded Script to be run just as the file begins to load <audio>, <video> onloadstart before anything is actually loaded Script to be run when a mouse button is All visible elements. onmousedown pressed down on an element Script to be run as long as the mouse pointer All visible elements. onmousemove is moving over an element Script to be run when a mouse pointer moves All visible elements. onmouseout out of an element Script to be run when a mouse pointer moves All visible elements. onmouseover over an element Script to be run when a mouse button is All visible elements. onmouseup released over an element Script to be run when a mouse wheel is being onmousewheel All visible elements. scrolled over an element Script to be run when the browser starts to work onoffline <body> offline Script to be run when the browser starts to work ononline <body> online Script to be run when a user navigates away onpagehide <body> from a page Script to be run when a user navigates to a onpageshow <body> Script to be run when the user pastes some All visible elements. onpaste content in an element Script to be run when the media is paused <audio>, <video> onpause either by the user or programmatically Script to be run when the media has started <audio>, <video> onplay playing Script to be run when the media has started onplaying <audio>, <video> playing Script to be run when the window's history onpopstate <body> changes. Script to be run when the browser is in the onprogress <audio>, <video> process of getting the media data Script to be run each time the playback rate onratechange <audio>, <video> changes (like when a user switches to a slow motion or fast forward mode). Script to be run when a reset button in a form is onreset <form> clicked.

<u>onresize</u>	 body>	Script to be run when the browser window is being resized.
<u>onscroll</u>	All visible elements.	Script to be run when an element's scrollbar is being scrolled
<u>onsearch</u>	<input/>	Script to be run when the user writes something in a search field (for <input="search">)</input="search">
onseeked	<audio>, <video></video></audio>	Script to be run when the seeking attribute is set to false indicating that seeking has ended
onseeking	<audio>, <video></video></audio>	Script to be run when the seeking attribute is set to true indicating that seeking is active
<u>onselect</u>	All visible elements.	Script to be run when the element gets selected
<u>onstalled</u>	<audio>, <video></video></audio>	Script to be run when the browser is unable to fetch the media data for whatever reason
onstorage	 body>	Script to be run when a Web Storage area is updated
<u>onsubmit</u>	<form></form>	Script to be run when a form is submitted
<u>onsuspend</u>	<audio>, <video></video></audio>	Script to be run when fetching the media data is stopped before it is completely loaded for whatever reason
<u>ontimeupdate</u>	<audio>, <video></video></audio>	Script to be run when the playing position has changed (like when the user fast forwards to a different point in the media)
<u>ontoggle</u>	<details></details>	Script to be run when the user opens or closes the <details> element</details>
<u>onunload</u>	<body></body>	Script to be run when a page has unloaded (or the browser window has been closed)
<u>onvolumechange</u>	<audio>, <video></video></audio>	Script to be run each time the volume of a video/audio has been changed
onwaiting	<audio>, <video></video></audio>	Script to be run when the media has paused but is expected to resume (like when the media pauses to buffer more data)
<u>onwheel</u>	All visible elements.	Script to be run when the mouse wheel rolls up or down over an element
<u>open</u>	<details></details>	Specifies that the details should be visible (open) to the user
<u>optimum</u>	<meter></meter>	Specifies what value is the optimal value for the gauge
<u>pattern</u>	<input/>	Specifies a regular expression that an <input/> element's value is checked against
placeholder	<input/> , <textarea>&lt;/td&gt;&lt;td&gt;Specifies a short hint that describes the expected value of the element&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;poster&lt;/td&gt;&lt;td&gt;&lt;video&gt;&lt;/td&gt;&lt;td&gt;Specifies an image to be shown while the video is downloading, or until the user hits the play button&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;preload&lt;/td&gt;&lt;td&gt;&lt;audio&gt;, &lt;video&gt;&lt;/td&gt;&lt;td&gt;Specifies if and how the author thinks the audio/video should be loaded when the page loads&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;u&gt;readonly&lt;/u&gt;&lt;/td&gt;&lt;td&gt;&lt;input&gt;, &lt;textarea&gt;&lt;/td&gt;&lt;td&gt;Specifies that the element is read-only&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;u&gt;rel&lt;/u&gt;&lt;/td&gt;&lt;td&gt;&lt;a&gt;, &lt;area&gt;, &lt;form&gt;, &lt;link&gt;&lt;/td&gt;&lt;td&gt;Specifies the relationship between the current document and the linked document&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;required&lt;/td&gt;&lt;td&gt;&lt;input&gt;, &lt;select&gt;, &lt;textarea&gt;&lt;/td&gt;&lt;td&gt;Specifies that the element must be filled out before submitting the form&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;reversed&lt;/td&gt;&lt;td&gt;&lt;u&gt;&lt;0 &gt;&lt;/u&gt;&lt;/td&gt;&lt;td&gt;Specifies that the list order should be descending (9,8,7)&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;rows&lt;/td&gt;&lt;td&gt;&lt;textarea&gt;&lt;/td&gt;&lt;td&gt;Specifies the visible number of lines in a text area&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;rowspan&lt;/td&gt;&lt;td&gt;&lt;u&gt;, &lt;/u&gt;&lt;/td&gt;&lt;td&gt;Specifies the number of rows a table cell should span&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;sandbox&lt;/td&gt;&lt;td&gt;&lt;iframe&gt;&lt;/td&gt;&lt;td&gt;Enables an extra set of restrictions for the content in an &lt;iframe&gt;&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;scope&lt;/td&gt;&lt;td&gt;&lt;u&gt;&gt;&lt;/u&gt;&lt;/td&gt;&lt;td&gt;Specifies whether a header cell is a header for a column, row, or group of columns or rows&lt;/td&gt;&lt;/tr&gt;&lt;/tbody&gt;&lt;/table&gt;</textarea>	

Specifies that an option should be pre-selected

when the page loads

<u>shape</u> <u><area></u> Specifies the shape of the area

Specifies the width, in characters (for <input>) size <input>, <select> or specifies the number of visible options (for

<select>)

 sizes
 <img>, <link>, <source>
 Specifies the size of the linked resource

 span
 <coly, <colgroup>
 Specifies the number of columns to span

 spellcheck
 Global Attributes
 Specifies whether the element is to have its

<audio>, <embed>, <iframe>, <img>,

<u>src</u> <u><input></u>, <u><script></u>, <u><source></u>, <u><track></u>,
Specifies the URL of the media file

<video>

<input>

srcdoc Specifies the HTML content of the page to

show in the <iframe>

srclang Specifies the language of the track text data

(required if kind="subtitles")

spelling and grammar checked or not

srcset <img>, <source> Specifies the URL of the image to use in

different situations

start 
 Specifies the start value of an ordered list

Specifies the legal number intervals for an input

field

styleGlobal AttributesSpecifies an inline CSS style for an elementtabindexGlobal AttributesSpecifies the tabbing order of an element

Specifies the target for where to open the linked

document or where to submit the form

titleGlobal AttributesSpecifies extra information about an elementtranslateGlobal AttributesSpecifies whether the content of an element

should be translated or not

<a>, <button>, <embed>, <input>, <link>,</a>

type <menu>, <object>, <script>, <source>, Specifies the type of element

<style>

usemap <img>, <object> Specifies an image as a client-side image map

value <a href="mailto:substantial-button"><a href="mailto:substant

<param>

width <canvas>, <embed>, <iframe>, <img>,

<input>, <object>, <video>

<a>>, <area>, <base>, <form>

wrapped when submitted in a form

Specifies the value of the element

Specifies the width of the element

### **HTML Global Attributes**

#### **HTML Global Attributes**

step

target

The global attributes are attributes that can be used with all HTML elements.

Attribute Description

<u>accesskey</u> Specifies a shortcut key to activate/focus an element

Specifies one or more classnames for an element (refers to a class in a style

sheet)

contenteditable
Specifies whether the content of an element is editable or not

data-\*
Used to store custom data private to the page or application

Specifies the text direction for the content in an element

draggable
Specifies whether an element is draggable or not

hidden Specifies that an element is not yet, or is no longer, relevant

id Specifies a unique id for an element

lang Specifies the language of the element's content

spellcheck Specifies whether the element is to have its spelling and grammar checked or not

styleSpecifies an inline CSS style for an elementtabindexSpecifies the tabbing order of an elementtitleSpecifies extra information about an element

translate Specifies whether the content of an element should be translated or not

# **HTML Reference - Browser Support**

### **HTML Reference With Browser Support**

The table below lists all HTML elements and their attributes, along with browser support:

# **HTML Event Attributes**

### **Global Event Attributes**

HTML has the ability to let events trigger actions in a browser, like starting a JavaScript when a user clicks on an element.

To learn more about programming events, please visit our JavaScript tutorial.

Below are the global event attributes that can be added to HTML elements to define event actions.

### **Window Event Attributes**

Events triggered for the window object (applies to the <body> tag):

Value

| Attribute             | Value  | Description  |
|-----------------------|--------|--|
| <u>onafterprint</u>   | script | Script to be run after the document is printed                               |
| <u>onbeforeprint</u>  | script | Script to be run before the document is printed                              |
| <u>onbeforeunload</u> | script | Script to be run when the document is about to be unloaded                   |
| <u>onerror</u>        | script | Script to be run when an error occurs  |
| <u>onhashchange</u>   | script | Script to be run when there has been changes to the anchor part of the a URL |
| <u>onload</u>         | script | Fires after the page is finished loading                                     |
| onmessage             | script | Script to be run when the message is triggered                               |
| <u>onoffline</u>      | script | Script to be run when the browser starts to work offline                     |
| <u>ononline</u>       | script | Script to be run when the browser starts to work online                      |
| onpagehide            | script | Script to be run when a user navigates away from a page                      |
| <u>onpageshow</u>     | script | Script to be run when a user navigates to a page                             |
| onpopstate            | script | Script to be run when the window's history changes                           |
| <u>onresize</u>       | script | Fires when the browser window is resized                                     |
| onstorage             | script | Script to be run when a Web Storage area is updated                          |
| <u>onunload</u>       | script | Fires once a page has unloaded (or the browser window has been closed)       |

### **Form Events**

A ++ vib. ı + o

Events triggered by actions inside a HTML form (applies to almost all HTML elements, but is most used in form elements):

Description

| Attribute            | value            | Description  |
|----------------------|------------------|--|
| <u>onblur</u>        | script           | Fires the moment that the element loses focus  |
| <u>onchange</u>      | script           | Fires the moment when the value of the element is changed                                      |
| <u>oncontextmenu</u> | script           | Script to be run when a context menu is triggered  |
| <u>onfocus</u>       | script           | Fires the moment when the element gets focus   |
| <u>oninput</u>       | script           | Script to be run when an element gets user input   |
| <u>oninvalid</u>     | script           | Script to be run when an element is invalid  |
| onreset              | script           | Fires when the Reset button in a form is clicked   |
| onsearch             | script           | Fires when the user writes something in a search field (for <input="search">)</input="search"> |
| onselect<br>onsubmit | script<br>script | Fires after some text has been selected in an element<br>Fires when a form is submitted        |
|                      |                  |  |

# **Keyboard Events**

| Attribute         | Value  | Description                         |
|-------------------|--------|-------------------------------------|
| <u>onkeydown</u>  | script | Fires when a user is pressing a key |
| <u>onkeypress</u> | script | Fires when a user presses a key     |
| <u>onkeyup</u>    | script | Fires when a user releases a key    |

### **Mouse Events**

| Attribute          | Value  | Description  |
|--------------------|--------|--|
| <u>onclick</u>     | script | Fires on a mouse click on the element                              |
| <u>ondblclick</u>  | script | Fires on a mouse double-click on the element                       |
| <u>onmousedown</u> | script | Fires when a mouse button is pressed down on an element            |
| onmousemove        | script | Fires when the mouse pointer is moving while it is over an element |
| <u>onmouseout</u>  | script | Fires when the mouse pointer moves out of an element               |
| <u>onmouseover</u> | script | Fires when the mouse pointer moves over an element                 |
| <u>onmouseup</u>   | script | Fires when a mouse button is released over an element              |
| onmousewheel       | script | Deprecated. Use the <u>onwheel</u> attribute instead               |
| <u>onwheel</u>     | script | Fires when the mouse wheel rolls up or down over an element        |

# **Drag Events**

| Attribute          | Value  | Description  |
|--------------------|--------|--|
| <u>ondrag</u>      | script | Script to be run when an element is dragged                                |
| <u>ondragend</u>   | script | Script to be run at the end of a drag operation                            |
| <u>ondragenter</u> | script | Script to be run when an element has been dragged to a valid drop target   |
| <u>ondragleave</u> | script | Script to be run when an element leaves a valid drop target                |
| <u>ondragover</u>  | script | Script to be run when an element is being dragged over a valid drop target |
| <u>ondragstart</u> | script | Script to be run at the start of a drag operation                          |
| <u>ondrop</u>      | script | Script to be run when dragged element is being dropped                     |
| <u>onscroll</u>    | script | Script to be run when an element's scrollbar is being scrolled             |

# **Clipboard Events**

| Attribute      | Value  | Description   |
|----------------|--------|---|
| <u>oncopy</u>  | script | Fires when the user copies the content of an element  |
| <u>oncut</u>   | script | Fires when the user cuts the content of an element    |
| <u>onpaste</u> | script | Fires when the user pastes some content in an element |

### **Media Events**

Events triggered by medias like videos, images and audio (applies to all HTML elements, but is most common in media elements, like <audio>, <embed>, <img>, <object>, and <video>).

Tip: Look at our HTML Audio and Video DOM Reference for more information.

| Attribute        | Value  | Description   |
|------------------|--------|---|
| onabort          | script | Script to be run on abort   |
| oncanplay        | script | Script to be run when a file is ready to start playing (when it has buffered enough to begin)   |
| oncanplaythrough | script | Script to be run when a file can be played all the way to the end without pausing for buffering |

| oncuechange      | script | Script to be run when the cue changes in a <track/> element   |
|------------------|--------|---|
| ondurationchange | script | Script to be run when the length of the media changes   |
| onemptied        | script | Script to be run when something bad happens and the file is suddenly unavailable (like unexpectedly disconnects)            |
| onended          | script | Script to be run when the media has reach the end (a useful event for messages like "thanks for listening")                 |
| onerror          | script | Script to be run when an error occurs when the file is being loaded   |
| onloadeddata     | script | Script to be run when media data is loaded  |
| onloadedmetadata | script | Script to be run when meta data (like dimensions and duration) are loaded   |
| onloadstart      | script | Script to be run just as the file begins to load before anything is actually loaded   |
| onpause          | script | Script to be run when the media is paused either by the user or programmatically  |
| onplay           | script | Script to be run when the media is ready to start playing   |
| onplaying        | script | Script to be run when the media actually has started playing  |
| onprogress       | script | Script to be run when the browser is in the process of getting the media data   |
| onratechange     | script | Script to be run each time the playback rate changes (like when a user switches to a slow motion or fast forward mode)      |
| onseeked         | script | Script to be run when the seeking attribute is set to false indicating that seeking has ended                               |
| onseeking        | script | Script to be run when the seeking attribute is set to true indicating that seeking is active                                |
| onstalled        | script | Script to be run when the browser is unable to fetch the media data for whatever reason                                     |
| onsuspend        | script | Script to be run when fetching the media data is stopped before it is completely loaded for whatever reason                 |
| ontimeupdate     | script | Script to be run when the playing position has changed (like when the user fast forwards to a different point in the media) |
| onvolumechange   | script | Script to be run each time the volume is changed which (includes setting the volume to "mute")                              |
| onwaiting        | script | Script to be run when the media has paused but is expected to resume (like when the media pauses to buffer more data)       |
|                  |        |   |

### **Misc Events**

| Attribute       | Value  | Description   |
|-----------------|--------|---|
| <u>ontoggle</u> | script | Fires when the user opens or closes the <details> element</details> |

# **HTML Color Names**

## **Color Names Supported by All Browsers**

All modern browsers support the following 140 color names (click on a color name, or a hex value, to view the color as the background-color along with different text colors):

For a full overview of HTML colors, visit our colors tutorial.

# **HTML Canvas Reference**

#### **HTML Canvas Reference**

The HTML <canvas> tag is used to draw graphics, on the fly, via scripting (usually JavaScript).

To learn more about <canvas>, please read our HTML Canvas tutorial.

### Colors, Styles, and Shadows

Property Description

Sets or returns the color, gradient, or pattern used to fill the

drawing

strokeStyle Sets or returns the color, gradient, or pattern used for strokes

<u>shadowColor</u><u>shadowBlur</u>Sets or returns the color to use for shadowsSets or returns the blur level for shadows

shadowOffsetX Sets or returns the horizontal distance of the shadow from the

shape

shadowOffsetY Sets or returns the vertical distance of the shadow from the shape

Method Description

createLinearGradient() Creates a linear gradient (to use on canvas content)
 createPattern() Repeats a specified element in the specified direction
 createRadialGradient() Creates a radial/circular gradient (to use on canvas content)
 addColorStop() Specifies the colors and stop positions in a gradient object

### **Line Styles**

Property Description

<u>lineCap</u> Sets or returns the style of the end caps for a line

lineJoin Sets or returns the type of corner created, when two lines

meet

lineWidthSets or returns the current line widthmiterLimitSets or returns the maximum miter length

### Rectangles

Method Description

rect() Creates a rectangle

<u>fillRect()</u> Draws a "filled" rectangle <u>strokeRect()</u> Draws a rectangle (no fill)

clearRect() Clears the specified pixels within a given

rectangle

#### **Paths**

Method Description

fill() Fills the current drawing (path)

stroke() Actually draws the path you have definedbeginPath() Begins a path, or resets the current path

moveTo() Moves the path to the specified point in the canvas, without creating a line

closePath() Creates a path from the current point back to the starting point

lineTo()

Adds a new point and creates a line to that point from the last specified point in the

canvas

clip() Clips a region of any shape and size from the original canvas

quadraticCurveTo() Creates a quadratic  $B\tilde{A}f\hat{A}$ ©zier curve bezierCurveTo() Creates a cubic  $B\tilde{A}f\hat{A}$ ©zier curve

arc() Creates an arc/curve (used to create circles, or parts of circles)

arcTo() Creates an arc/curve between two tangents

#### isPointInPath()

#### **Transformations**

Method Description

scale() Scales the current drawing bigger or smaller

<u>rotate()</u> Rotates the current drawing

<u>translate()</u> Remaps the (0,0) position on the canvas

transform()

Replaces the current transformation matrix for the drawing

SetTransform()

Resets the current transform to the identity matrix. Then runs

<u>transform()</u>

#### **Text**

Property Description

font Sets or returns the current font properties for text content textAlign Sets or returns the current alignment for text content

textBaseline Sets or returns the current text baseline used when drawing

text

MethodDescriptionfillText()Draws "filled" text on the canvasstrokeText()Draws text on the canvas (no fill)

measureText() Returns an object that contains the width of the specified

text

### **Image Drawing**

Method Description

drawlmage() Draws an image, canvas, or video onto the

canvas

### **Pixel Manipulation**

Property Description

width Returns the width of an ImageData object
height Returns the height of an ImageData object

data

Returns an object that contains image data of a specified ImageData

object

Method Description

<u>createImageData()</u> Creates a new, blank ImageData object

getImageData()

Returns an ImageData object that copies the pixel data for the specified rectangle on a

canvas

putImageData() Puts the image data (from a specified ImageData object) back onto the canvas

### Compositing

Property Description

globalAlpha Sets or returns the current alpha or transparency value of the drawing globalCompositeOperation Sets or returns how a new image is drawn onto an existing image

#### Other

| Method        | Description  |
|---------------|--|
| save()        | Saves the state of the current context             |
| restore()     | Returns previously saved path state and attributes |
| createEvent() | Â  |

### HTML Audio/Video DOM Reference

#### **HTML Audio and Video DOM Reference**

The HTML5 DOM has methods, properties, and events for the <audio> and <video> elements.

#### **HTML Audio/Video Methods**

Method Description

addTextTrack() Adds a new text track to the audio/video

canPlayType() Checks if the browser can play the specified audio/video

type

load() Re-loads the audio/video element play() Starts playing the audio/video

pause() Pauses the currently playing audio/video

### **HTML Audio/Video Properties**

Property Description

<u>audioTracks</u> Returns an AudioTrackList object representing available audio tracks

autoplay
Sets or returns whether the audio/video should start playing as soon as it is loaded
buffered
Returns a TimeRanges object representing the buffered parts of the audio/video
Returns the MediaController object representing the current media controller of the

audio/video

<u>controls</u> Sets or returns whether the audio/video should display controls (like play/pause etc.)

crossOrigin Sets or returns the CORS settings of the audio/video

currentSrc Returns the URL of the current audio/video

<u>currentTime</u> Sets or returns the current playback position in the audio/video (in seconds)

defaultMutedSets or returns whether the audio/video should be muted by defaultdefaultPlaybackRateSets or returns the default speed of the audio/video playbackdurationReturns the length of the current audio/video (in seconds)

ended Returns whether the playback of the audio/video has ended or not

error Returns a MediaError object representing the error state of the audio/video loop Sets or returns whether the audio/video should start over again when finished

mediaGroup

Sets or returns the group the audio/video belongs to (used to link multiple audio/video

elements)

mutedSets or returns whether the audio/video is muted or notnetworkStateReturns the current network state of the audio/videopausedReturns whether the audio/video is paused or notplaybackRateSets or returns the speed of the audio/video playback

played

Returns a TimeRanges object representing the played parts of the audio/video

preload

Sets or returns whether the audio/video should be loaded when the page loads

readyState Returns the current ready state of the audio/video

seekable Returns a TimeRanges object representing the seekable parts of the audio/video

seekingReturns whether the user is currently seeking in the audio/videosrcSets or returns the current source of the audio/video elementstartDateReturns a Date object representing the current time offset

<u>textTracks</u>
Returns a TextTrackList object representing the available text tracks

<u>videoTracks</u>
Returns a VideoTrackList object representing the available video tracks

volume Sets or returns the volume of the audio/video

#### HTML Audio/Video Events

**Event** Description

<u>abort</u>

Sires when the loading of an audio/video is aborted

Canplay

Fires when the browser can start playing the audio/video

canplaythrough Fires when the browser can play through the audio/video without stopping for

buffering

duration of the audio/video is changed

emptied Fires when the current playlist is empty ended Fires when the current playlist is ended

errorFires when an error occurred during the loading of an audio/videoloadeddataFires when the browser has loaded the current frame of the audio/videoloadedmetadataFires when the browser has loaded meta data for the audio/video

<u>loadstart</u> Fires when the browser starts looking for the audio/video

pause Fires when the audio/video has been paused

play Fires when the audio/video has been started or is no longer paused

playing Fires when the audio/video is playing after having been paused or stopped for

buffering

progress Fires when the browser is downloading the audio/video ratechange Fires when the playing speed of the audio/video is changed

seeked Fires when the user is finished moving/skipping to a new position in the audio/video
 seeking Fires when the user starts moving/skipping to a new position in the audio/video
 stalled Fires when the browser is trying to get media data, but data is not available

<u>suspend</u> Fires when the browser is intentionally not getting media data

<u>timeupdate</u> Fires when the current playback position has changed

<u>volumechange</u> Fires when the volume has been changed

waiting Fires when the video stops because it needs to buffer the next frame

### HTML <!DOCTYPE>

### The HTML Document Type

All HTML documents must start with a <!DOCTYPE> declaration.

The declaration is not an HTML tag. It is an "information" to the browser about what document type to expect.

In HTML5, the <IDOCTYPE> declaration is simple:

<!DOCTYPE html>

In older documents (HTML 4 or XHTML), the declaration is more complicated because the declaration must refer to a DTD (Document Type Definition).

<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd"> <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.1//EN" "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">

You can read more about document types in the <!DOCTYPE> reference.

#### Valid HTML Elements in Different DOCTYPES

| Tag                 | HTML | 5 HTML | 4 XHTML |
|---------------------|------|--------|---------|
| <u><a></a></u>      | Yes  | Yes    | Yes     |
| <abbr></abbr>       | Yes  | Yes    | Yes     |

# **HTML Character Sets**

### **Common HTML Character Sets**

The default character set in HTML5 is UTF-8.

For a closer look, visit our Complete HTML Character Set Reference.

Number	ASCII	ANSI	8859-1	UTF-8	Description
32					space
33	!	!	!	!	exclamation mark
34	"	"	"	"	quotation mark
35	#	#	#	#	number sign
36	\$	\$	\$	\$	dollar sign
37	%	%	%	%	percent sign
38	&	&	&	&	ampersand
39	•	•	•	•	apostrophe
40	(	(	(	(	left parenthesis
41	)	)	)	)	right parenthesis
42	*	*	*	*	asterisk
43	+	+	+	+	plus sign
44	,	,	,	,	comma
45	-	-	-	-	hyphen-minus
46					full stop
47	/	/	/	/	solidus
48	0	0	0	0	digit zero
49	1	1	1	1	digit one
50	2	2	2	2	digit two
51	3	3	3	3	digit three
52	4	4	4	4	digit four
53	5	5	5	5	digit five
54	6	6	6	6	digit six
55	7	7	7	7	digit seven
56	8	8	8	8	digit eight
57	9	9	9	9	digit nine
58	:	:	:	:	colon
59	;	;	;	;	semicolon
60	<	<	<	<	less-than sign
61	=	=	=	=	equals sign
62	>	>	>	>	greater-than sign
63	?	?	?	?	question mark
64	@	@	@	@	commercial at
65	Α	Α	Α	Α	Latin capital letter A
66	В	В	В	В	Latin capital letter B
67	С	С	С	С	Latin capital letter C
68	D	D	D	D	Latin capital letter D
69	Е	E	E	E	Latin capital letter E
70	F	F	F	F	Latin capital letter F
71	G	G	G	G	Latin capital letter G
72	Н	Н	Н	Н	Latin capital letter H
73	1	1	1	1	Latin capital letter I
74	J	J	J	J	Latin capital letter J
75	K	K	K	K	Latin capital letter K
76	L	L	L	L	Latin capital letter L
77	М	M	M	М	Latin capital letter M
78	N	N	N	N	Latin capital letter N
79	0	0	0	0	Latin capital letter O
80	Р	Р	Р	Р	Latin capital letter P
81	Q	Q	Q	Q	Latin capital letter Q

82	R	R	R	R	Latin capital letter R
83	S	S	S	S	Latin capital letter S
84	Τ	T	T	T	Latin capital letter T
85	U	U	U	U	Latin capital letter U
86	V	V	V	V	Latin capital letter V
87	W	W	W	W	Latin capital letter W
88	X	X	X	X	Latin capital letter X
89	Y	Y	Y	Y	Latin capital letter Y
90	Z	Z	Z	Z	•
					Latin capital letter Z
91	[	[	[	[	left square bracket
92	\	\	\	\	reverse solidus
93	]	]	]	]	right square bracket
94	٨	٨	٨	٨	circumflex accent
95	_	_	_	_	low line
96	_	•	`	•	grave accent
97	а	а	а	а	Latin small letter a
98	b	b	b	b	Latin small letter b
99	С	С	С	С	Latin small letter c
100	d	d	d	d	Latin small letter d
	_	_	_	_

# **HTML URL Encoding Reference**

#### **URL - Uniform Resource Locator**

Web browsers request pages from web servers by using a URL.

The URL is the address of a web page, like:https://www.w3schools.com.

### **URL Encoding (Percent Encoding)**

URL encoding converts characters into a format that can be transmitted over the Internet.

URLs can only be sent over the Internet using the ASCII character-set.

Since URLs often contain characters outside the ASCII set, the URL has to be converted into a valid ASCII format.

URL encoding replaces unsafe ASCII characters with a "%" followed by two hexadecimal digits.

URLs cannot contain spaces. URL encoding normally replaces a space with a plus (+) sign or with %20.

### Try It Yourself

If you click the "Submit" button below, the browser will URL encode the input before it is sent to the server. A page at the server will display the received input.

Hello GÄfļnter	Submit

Try some other input and click Submit again.

### **URL Encoding Functions**

In JavaScript, PHP, and ASP there are functions that can be used to URL encode a string.

PHP has the rawurlencode() function, and ASP has the Server.URLEncode() function.

In JavaScript you can use the encodeURIComponent() function.

Click the "URL Encode" button to see how the JavaScript function encodes the text.

Hello GĀf¼nter	URL Encode

**Note:** The JavaScript function encodes space as %20.

### **ASCII Encoding Reference**

Your browser will encode input, according to the character-set used in your page.

The default character-set in HTML5 is UTF-8.

Character	From Windows- 1252	From UTF-8

### **URL Encoding Reference**

The ASCII control characters %00-%1F were originally designed to control hardware devices.

Control characters have nothing to do inside a URL.

ASCII Character	Description	URL-encoding
NUL	null character	%00
SOH	start of header	%01
STX	start of text	%02
ETX	end of text	%03

# **HTML Language Code Reference**

## **ISO Language Codes**

You should always include the <u>lang</u> attribute inside the <u><html></u> tag, to declare the language of the Web page. This is meant to assist search engines and browsers:

```
<html lang="en">
...
</html>
In XHTML, the language is declared inside the<html> tag as follows:
<html xmlns="http://www.w3.org/1999/xhtml" lang="en" xml:lang="en">
...
</html>
```

# ISO 639-1 Language Codes

# **HTTP Status Messages**

### **HTML Error Messages**

When a browser requests a service from a web server, an error might occur, and the server might return an error code like "404 Not Found".

It is common to name these errors HTML error messages.

But these messages are something called HTTP status messages. In fact, the server always returns a message for every request. The most common message is 200 OK.

Below is a list of HTTP status messages that might be returned:

#### 1xx: Information

Message:	Description:
100 Continue	The server has received the request headers, and the client should proceed to send the request body
101 Switching Protocols	The requester has asked the server to switch protocols
103 Checkpoint	Used in the resumable requests proposal to resume aborted PUT or POST requests

### 2xx: Successful

Message: Description:

The request is OK (this is the standard response for successful HTTP 200 OK requests)

201 Created The request has been fulfilled, and a new resource is createdÂ

The request has been accepted for processing, but the processing has not 202 Accepted

been completed

The request has been successfully processed, but is returning information 203 Non-Authoritative Information

that may be from another source

The request has been successfully processed, but is not returning any 204 No Content

content

The request has been successfully processed, but is not returning any 205 Reset Content

content, and requires that the requester reset the document view

The server is delivering only part of the resource due to a range header 206 Partial Content

sent by the client

#### 3xx: Redirection

Message: **Description:** 

A link list. The user can select a link and go to that location. Maximum five 300 Multiple Choices

addresses A

301 Moved Permanently The requested page has moved to a new URLÂ

302 Found The requested page has moved temporarily to a new URLÂ 303 See Other The requested page can be found under a different URL

304 Not Modified Indicates the requested page has not been modified since last requested

306 Switch Proxy No longer used

307 Temporary Redirect The requested page has moved temporarily to a new URL

Used in the resumable requests proposal to resume aborted PUT or 308 Resume Incomplete

POST requests

#### 4xx: Client Error

414 Request-URI Too Long

**Description:** Message:

400Â Bad Request The request cannot be fulfilled due to bad syntax

The request was a legal request, but the server is refusing to respond to it. 401 Unauthorized

For use when authentication is possible but has failed or not yet been

provided

402 Payment Required Reserved for future use

403 Forbidden The request was a legal request, but the server is refusing to respond to it

The requested page could not be found but may be available again in the 404 Not Found

future

A request was made of a page using a request method not supported by 405 Method Not Allowed

406 Not Acceptable The server can only generate a response that is not accepted by the client

407 Proxy Authentication Required The client must first authenticate itself with the proxy

408 Request Timeout The server timed out waiting for the request

409 Conflict The request could not be completed because of a conflict in the request

410 Gone The requested page is no longer available

The "Content-Length" is not defined. The server will not accept the 411 Length Required

request without itÂ

412 Precondition Failed The precondition given in the request evaluated to false by the server

The server will not accept the request, because the request entity is too 413 Request Entity Too Large

The server will not accept the request, because the URL is too long.

Occurs when you convert a POST request to a GET request with a long

query informationA

The server will not accept the request, because the media type is not 415 Unsupported Media Type

supportedA

The client has asked for a portion of the file, but the server cannot supply 416Â Requested Range Not Satisfiable

that portion

#### 5xx: Server Error

Message: Description:

500Â Internal Server Error

A generic error message, given when no more specific message is

suitable

The server either does not recognize the request method, or it lacks the

501 Not Implemented ability to fulfill the request

The server was acting as a gateway or proxy and received an invalid

response from the upstream server

503 Service Unavailable The server is currently unavailable (overloaded or down)

The server was acting as a gateway or proxy and did not receive a timely

response from the upstream server

505 HTTP Version Not Supported

The server does not support the HTTP protocol version used in the

request

511 Network Authentication Required The client needs to authenticate to gain network access

# **HTTP Request Methods**

#### What is HTTP?

The Hypertext Transfer Protocol (HTTP) is designed to enable communications between clients and servers.

HTTP works as a request-response protocol between a client and server.

Example: A client (browser) sends an HTTP request to the server; then the server returns a response to the client. The response contains status information about the request and may also contain the requested content.

#### **HTTP Methods**

- GET
- POST
- PUT
- HEAD
- DELETEPATCH
- OPTIONS

The two most common HTTP methods are: GET and POST.

#### The GET Method

GET is used to request data from a specified resource.

GET is one of the most common HTTP methods.

Note that the query string (name/value pairs) is sent in the URL of a GET request:

/test/demo\_form.php?name1=value1&name2=value2

#### Some other notes on GET requests:

- GET requests can be cached
- · GET requests remain in the browser history
- GET requests can be bookmarked
- GET requests should never be used when dealing with sensitive data
- · GET requests have length restrictions
- GET requests are only used to request data (not modify)

#### The POST Method

POST is used to send data to a server to create/update a resource.

The data sent to the server with POST is stored in the request body of the HTTP request:

POST /test/demo\_form.php HTTP/1.1 Host: w3schools.com name1=value1&name2=value2

POST is one of the most common HTTP methods.

#### Some other notes on POST requests:

- POST requests are never cached
- · POST requests do not remain in the browser history
- · POST requests cannot be bookmarked
- POST requests have no restrictions on data length

#### The PUT Method

PUT is used to send data to a server to create/update a resource.

The difference between POST and PUT is that PUT requests are idempotent. That is, calling the same PUT request multiple times will always produce the same result. In contrast, calling a POST request repeatedly have side effects of creating the same resource multiple times.

#### The HEAD Method

HEAD is almost identical to GET, but without the response body.

In other words, if GET /users returns a list of users, then HEAD /users will make the same request but will not return the list of users.

HEAD requests are useful for checking what a GET request will return before actually making a GET request - like before downloading a large file or response body.

#### The DELETE Method

The DELETE method deletes the specified resource.

#### The OPTIONS Method

The OPTIONS method describes the communication options for the target resource.

### Compare GET vs. POST

The following table compares the two HTTP methods: GET and POST.

Â	GET	POST
BACK button/Reload	Harmless	Data will be re-submitted (the browser should alert the user that the data are about to be re-submitted)
Bookmarked	Can be bookmarked	Cannot be bookmarked
Cached	Can be cached	Not cached
Encoding type	application/x-www-form-urlencoded	application/x-www-form-urlencoded or multipart/form-data. Use multipart encoding for binary data
History	Parameters remain in browser history	Parameters are not saved in browser history

Yes, when sending data, the GET method adds the data to the URL; and the length Restrictions on data length No restrictions of a URL is limited (maximum URL length is 2048 characters) Restrictions on data type Only ASCII characters allowed No restrictions. Binary data is also allowed GET is less secure compared to POST because data sent is part of the URL POST is a little safer than GET because Security the parameters are not stored in browser Never use GET when sending passwords history or in web server logs or other sensitive information! Visibility Data is not displayed in the URL Data is visible to everyone in the URL

### **Pixels to Ems Conversion**

#### **Pixel to Em Converter**

The tool below allows you to work out the em sizes from pixels (or vice versa).

- Set a default pixel size for body (usually 16px)
- Then, convert a pixel value to em, based on the default pixel size
- Or, convert an em value to pixels, based on the default pixel size

16 px		
Convert PX to EM:		
px		
Convert EM to PX:		
em		
Convert		

### **Body Font Size**

In the table below, select a body font size in pixels (px) to display a complete "px to em and percent" conversion table.

Tip: The default font size is usually 16px.

#### What is the difference between PX, EM and Percent?

Pixel is a static measurement, while percent and EM are relative measurements. The size of an EM or percent depends on its parent. If the text size of body is 16 pixels, then 150% or 1.5 EM will be 24 pixels (1.5 \* 16). Look at <u>CSS Units</u> for more measurement units.

# **Keyboard Shortcuts**

### **Keyboard Shortcuts For Windows and Mac**

Keyboard shortcuts are often used in modern operating systems and computer software programs.

Learning and using keyboard shortcuts can save you a lot of time.

### **Basic Shortcuts**

Description	Windows	Mac OS
Edit menu	Alt + E	Ctrl + F2 + F
File menu	Alt + F	Ctrl + F2 + E
View menu	Alt + V	Ctrl + F2 + V
Select all text	Ctrl + A	Cmd + A
Copy text	Ctrl + C	Cmd + C
Find text	Ctrl + F	Cmd + F
Find and replace text	Ctrl + H	Cmd + F
New Document	Ctrl + N	Cmd + N
Open a file	Ctrl + O	Cmd + O
Print options	Ctrl + P	Cmd + P
Save file	Ctrl + S	Cmd + S
Paste text	Ctrl + V	Cmd + V
Cut text	Ctrl + X	Cmd + X
Redo text	Ctrl + Y	Shift + Cmd + Z
Undo text	Ctrl + Z	Cmd + Z

## **Text Editing**

Description	Windows	Mac OS
